v.57

INDEX TO VOLUME LVII.

Illustrated Articles Indicated by *.

A.

Abram Cox Stove Company, Jan 18, p 28
Acetylene:
  Electricity and acetylene, March 1, p 29
  Experiments with, May 17, p 73
  Laboratory use of, March 2, p 37
Acetylene gas stoves, March 15, p 32*
Acetylene generators:
  English, April 12, p 39
  New German, May 17, p 64
Acetylene insect trap, April 19, p 51
Acetylene lighting, May 17, p 61
  Field for plumbers, April 19, p 39
  Town plants for, June 7, p 39*
Acid fumes, Protection from breathing, May 17, p 70; 31, p 50
Acid well ejector, Feb 22, p 44*
Acme gas appliances, March 1, p 31
Adams & Elting Company's specialties, Jan 4, p 41
Adler, H., Company extension, May 3, p 35
Advertising:
  Advertising end, The, June 7, p 50
  Good advertising, Jan 11, p 48
  Heating contractor's circular, April 19, p 39
  Programme advertising unprofitable, March 8, p 33
  Successful sign advertising, May 24, p 48
Air, Moistening, April 26, p 47
Air bound pipes, Jan 18, p 44*; Feb 8, p 40*; March 22, p 50*; April 5, p 50
Air chambers, Supply pipe, Jan 11, p 41*
Ajax Metal Company, May 31, p 53
Alaska Freezer Company, May 24, p 38
Alaska stove trimmings, Jan 25, p 30
Albany Master Plumbers' Association, Jan 4, p 49
Aluminum:
  A disappointing metal, March 29, p 51
  Australian aluminum, May 24, p 52
  Production in 1901, June 21, p 38
Aluminum alloy, New, May 10, p 55
Aluminum castings:
  Difficult, April 26, p 35*
  Pin holes in, May 17, p 70
Aluminum Cooking Utensil Company, March 29, p 29
Aluminum paint, Feb 1, p 39
  Peerless enamel, March 15, p 54
Aluminum solder, March 15, p 50
Aluminum utensils, June 14, p 37*
  Care of, April 12, p 30
Amalgamated Association, Jan 11, p 46; April 19, p 47
  Abolishment of strikes, Feb 8, p 27
  Increased membership, June 7, p 47
  Wage committees, April 26, p 39; May 3, p 31
  Wage scales, March 29, p 24; May 3, p 51; 10, p 37
American Blower Company, Feb 15, p 39
American Can Company, April 26, p 39
American exhibition in London, March 22, p 36
American Foundrymen's Association, June 21, p 38
American Hardware Corporation, March 22, p 32
American Radiator Company, Financial statement, March 8, p 53
American Rolling Mill Company, Feb 1, p 44
American School of Correspondence, June 21, p 35
American Sheet Steel Company:
  Extensions, March 8, p 45
  Production of heavy sheets, Feb 8, p 46
  Wage agreement, March 29, p 47
American Society of Heating and Ventilating Engineers, Conventions, Jan 18, p 39; 25, p 39; April 12, p 36; 19, p 39; May 17, p 59; June 7, p 38; 21, p 35, 36*
American Steel & Wire Company, Pensioning employees, Jan 11, p 25
American Stove Company, Officers, Jan 11, p 27; 18, p 27
American Stove, Range & Foundry Company, March 22, p 29
American Tube & Stamping Company, Jan 25, p 31
Anderson sanitary coupling, Feb 15, p 42*
Apprenticeship and technical instruction, April 12, p 41
Apprenticeship ratio in the foundry trade, March 29, p 26
Arbitration, Outlook for, Jan 11, p 25; Feb 1, p 29
Arbitration in difficulties of Dayton Cash Register Company, March 29, p 23
Arkansas Retail Hardware Dealers' Association, May 31, p 35; June 28, p 43
Astor House Stove Association, Jan 18, p 27; 25, p 30
Atlanta Rolling Mill & Tin Plate Company, May 3, p 50; 24, p 49
Atlantic City conventions, March 29, p 23, 36; April 12, p 36; 19, p 39
Auld & Conger Company, March 1, p 44
Aurora Acetylene Company, June 7, p 42
Australasian Master Plumbers' Association, Jan 11, p 42
Australian tin and tin mining, Feb 8, p 45
Avery, B. F., & Sons, Drinking water for workmen, May 10, p 41
Avery Stamping Company, June 21, p 61

B.

Ball cock, U. S. high pressure, April 5, p 44*
Baltimore Master Plumbers' Association, March 22, p 42
Baltimore Master Plumbers' Mutual Protective Association, March 1, p 50
Barnard, W. H., & Co., Norfolk, Va., June 28, p 51
Barry Mfg. Company, March 29, p 40
Barwick, Thomas. Hospitals for contagious diseases and their ventilation, Jan 25, p 45
Bath for dipping brass, May 31, p 50
Bathroom coils heated by water back, March 22, p 43*; April 12, p 51
Bathtubs:
  Enameling rough cast iron, March 29, p 42
  Glass, March 8, p 52
Bathtubs for royalty, May 24, p 41
Baths, Need of public, in New York City, April 19, p 30
Bayles, James C. The National Association, May 17, p 47
Beading gutters, May 10, p 51*; 17, p 70
Bed warmers, March 15, p 54
Behrer, Martin, Portrait, March 29, p 39*
Bell, H. F. Tommy engages in the hardware business, Jan 11, p 33
Bellmark Pottery Company, Jan 18, p 38
Berger Mfg. Company, Feb 15, p 47
Beseman & Bostwick, Hartford, Jan 11, p 47
Biersach fireproof window, Feb 22, p 51
Bill, A disputed, April 26, p 52*; May 3, p 53
Binghamton Master Plumbers' Association, Feb 1, p 48
Blast furnaces, Rated capacity and actual product, May 3, p 31
Blowers, A B C volume, March 1, p 45*
Boiler connections:
  Furnace and boiler, Feb 1, p 52*
  Problem in, March 1, p 54*; 8, p 58*; April 12, p 52*; 26, p 51*
  Quick heating connections, March 29, p 50*; April 19, p 50*
Boiler consolidation, Rumor of, Feb 22, p 45
Boiler power, A question of, Feb 15, p 51; 22, p 53
Boiler trade:
  Foreign trade in 1901, Jan 4, p 49
  Review of 1901 trade, Jan 4, p 28
  Steady market, Feb 2, p 31
Boilers:
  American and Advance, April 5, p 41*
  Bartlett sanitary, April 26, p 45
  Capitol, May 24, p 45
  Cast iron, for low pressure steam and hot water heating, Jan 18, p 37
  Crawford, April 19, p 40*
  Davis, June 28, p 53*
  European heating boilers, Jan 4, p 44*
  Florida improved, May 24, p 45*
  Galva steam and hot water, June 21, p 54
  Gorton, in Yale Club Building, April 26, p 43
  Gurney 400 series, June 7, p 39*
  Heating surface in, Feb 8, p 27
  Ideal, April 5, p 45
  Ideal Premier, June 7, p 42*
  Imperial and Keystone, June 21, p 50
  Mott, March 22, p 42
  Noisy boilers, Feb 15, p 51
  Novel steam boiler, March 22, p 51
  Pennington M. B. M., Jan 18, p 38
  Reducing pressure on hot water boilers, March 22, p 51
  Repairing a range boiler, April 12, p 40*
  Richmond, May 31, p 38
  Richmond magazine, June 7, p 40*
  Rusty tubes in new boilers, March 22, p 42
  Safety valve on kitchen boiler, March 15, p 50
  1200 series Bright Idea, May 3, p 41*
  Temperature controller, May 17, p 62*
  Torrid fine coal, May 24, p 40*
  Walker, May 24, p 45*
  Why the boiler was condemned, Feb 15, p 40*
  Wreck of copper boiler, May 17, p 62
Bolger, Walter F., wanted, Jan 25, p 46
Bolton, R. P. Depreciation, maintenance and interest charges, Jan 25, p 44
Bolts, Expansion, March 29, p 40*
Book reviews:
  Blank Book for Lettering, J. C. L. Fish, Jan 4, p 58
  Brass Founders' Alloys, J. F. Buchanan, April 12, p 52
  Dean's System of Greenhouse Heating, May 10, p 48
  Dipping, Burnishing, Lacquering and Bronzing Brass Ware, W. N. Brown, May 17, p 67
  Light, Heat and Power in Buildings, A. D. Adams, Jan 25, p 28
  Linear Drawing and Lettering for Beginners, J. C. L. Fish, Jan 4, p 58

420976

Book reviews (continued):
Municipal Engeering and Sanitation, M. N. Baker, April 12, p 52
Boston Trade Exposition, April 26, p 35
Bowls, Setting lavatory, June 7, p 41*
Bracket, Wisconsin adjustable, Feb 15, p 34*
Brass crafters, March 29, p 43
Brazil, Water works, drainage and plumbing in, June 21, p 55
Bread pan, Pattern for, Feb 15, p 48*
Brecher-Buck Company, May 31, p 32
Bridgeport Master Plumbers' Association, Feb 15, p 41
Briscoe Mfg. Company, May 24, p 48
British Institution of Heating and Ventilating Engineers, Feb 22, p 40
Brooklyn Master Plumbers' Association, Jan 11, p 42; 25, p 46
Broomell's patent vapor system, May 17, p 60*
Bruce & Cook, New York, Jan 11, p 47; Feb 1, p 44
Bucket, Pattern for flaring, April 12, p 48*
Budke Iron & Steel Company, May 24, p 49
Buffalo Master Plumbers' Association, Feb 22, p 43
Buffalo plumbers' dinner, Feb 8, p 41
Building strikes, Plan to avert, Feb 1, p 57
Building trade:
Building situation, March 22, p 27; May 3, p 31
New York, March 15, p 25
Southern activity, May 31, p 29
Buildings:
High, with light and air for sale, May 31, p 30
Skyscrapers in New York, April 5, p 30
Burners for gas stoves, English patents, March 29, p 26
Burton, W. J., & Co., April 26, p 37; May 17, p 56
Burton roofing, May 24, p 48
Business facilities, Modern, Feb 15, p 28.
Business failures in 1901, Jan 11, p 25
Business methods:
Economies, Minute, Jan 18, p 25
Estimating on jobs, Jan 25, p 49
Invoices, Location of date on, March 1, p 37
Keeping track of contracts and jobs, Jan 4, p 46; March 1, p 37
Pricing stock in plain figures, Jan 11, p 31
Profits in manufacturing, Jan 18, p 25
Receipts for remittances, Jan 11, p 31
Selling goods on installments, March 1, p 37
Selling heating apparatus, Jan 25, p 28
Business problems, April 26, p 27
Business situation of the United States, April 5, p 29
Business success, Causes of, May 10, p 30

C.

Cabinet for fittings, April 26, p 46*
Coke cutters, May 10, p 38*
Coke pans, Fluted, Feb 1, p 43*
California Master Plumbers' Association, May 3, p 46
California State Retail Hardware Association, March 22, p 33; April 12, p 31
Calorific Heater & Mfg. Company, Feb 15, p 41; May 10, p 43
Can opener, Derby Twentieth Century, Jan 18, p 32*
Cans, Tin, Paint to prevent rust, March 15, p 48
Canton Machine & Mfg. Company, Jan 11, p 17
Canton Steel Roofing Company, May 10, p 39
Cape Cod Commercial Travelers' Association, Jan 18, p 32
Car famine and a scarcity of fuel and steel, Feb 22, p 31; March 8, p 56
Carnahan plants at Canton, Ohio, Feb 15, p 47
Carnegie, Andrew, plumber, May 31, p 37
Carpet stretcher, King, May 31, p 36*
Carton, William J., Biographical sketch, April 19, p 31
Cast iron boilers for low pressure steam and hot water heating, Jan 18, p 37
Castings:
Aluminum, April 26, p 35*; May 17, p 70
Shrinkage of Composition, May 24, p 51
Castle, Chauncey H., Portrait, May 17, p 41*
Ceilings, Metal, Feb 1, p 42*; March 29, p 15*; April 5, p 47* 26, p 37, 38*; May 10, p 40
Cement:
Callahan roof cement, Jan 18, p 34
Old recipes, March 29, p 55
Stowell roof cement, Jan 18, p 35
Central station heating, Jan 11, p 37*; Feb 8, p 39
Central Supply Company, March 8, p 49
Century Stove & Mfg. Company, April 19, p 31
Chair made of pipe, March 1, p 17*
Champion Sanitary Enamel Ware Company, March 29, p 37
Chapman forges and emery grinding machine, May 3, p 54
Chattanooga Master Plumbers' Association, March 1, p 50
Chicago Hardwaremen's Annual Ball, Feb 1, p 38
Chicago Heater & Supply Company, May 17, p 59
Chimneys:
Poor draft in stone chimney, Jan 18, p 44*; 25, p 50; Feb 8, p 48*; March 8, p 58
Reasonings on smoky flues, open grates, &c., Jan 11, p 28*
China, Tinware and tinsmiths' tools in, April 5, p 47
Church heating, April 26, p 53*; May 17, p 69*
Church lighting, April 19, p 45
Church ventilation, May 17, p 66
Cincinnati Master Plumbers' Association, Jan 11, p 42
Cincinnati Punch & Shear Company, May 3, p 51
Circular of heating contractor, April 19, p 39
Clamp, Granton adjustable hopper, April 19, p 41*
Clark Novelty Company, Feb 1, p 36
Clarke, John D., Resolutions on death of, Feb 15, p 40
Cleveland Co-operative Stove Company, Feb 15, p 30; May 3, p 33
Cleveland Master Plumbers' Association, Feb 1, p 48
Cleveland Stamping & Tool Company, April 5, p 39
Clock, Waggoner watchman, April 26, p 41
Closets, (See Water Closets)
Clow, J. B., & Sons, New building, March 22, p 37
Coal hods, Corrugated, May 3, p 39*
Coal, production in 1901, June 14, p 32
Coal strike, May 10, p 29; 31, p 29; June 21, p 33
Coal tar products, Uses of, June 7, p 49
Coal Tar Products Association, April 19, p 47
Coal trade, Anthracite, of 1901, Jan 4, p 31
Coffee grinders:
Cleveland rapid, May 3, p 39*
Ohio, June 21, p 59*
Oplex, May 17, p 53*
Coffee pot pattern, May 31, p 44*
Coffee pots:
Ideal percolating, June 21, p 59*
Pelouze percolator, June 7, p 36
Coils heated from water back, March 22, p 43*; April 12, p 51*
Colander pattern, June 28, p 50*
Cold working sheet metal in dies, June 7, 46*; 14, p 60*
Colebrook "poem," Feb 15, p 30
Coleized steel hot blast range, May 17, p 50*
Colors that harmonize, June 21, p 44
Columbia Can Company, May 24, p 49
Columbian Enameling & Stamping Company's new plant, March 22, p 34
Colwell Lead Company, March 29, p 43
Conductor pipe corrugating and grooving machine, Jan 18, p 34*
Conductor pipes, Putting up, June 14, p 51*
Connecticut Master Plumbers' Association, March 1, p 50; May 17, p 59
Conservatory, Heating of, June 7, p 51; 14, p 55
Consolidation:
Advantages of, June 7, p 37
Combinations aid wage earners, April 12, p 26
Industrial consolidations in 1901, Jan 4, p 31
National corporation act, March 15, p 26
Consular reports, Value of, Jan 18, p 26
Cook book issued by George M. Clark & Co., April 5, p 31
Cooker, Ohio steam, June 14, p 38*
Cooling auditorium by use of ice, June 21, p 54
Cooling machine, Gravity, June 7, p 41
Cooney, John W., and his plumbing work, June 14, p 46*
Cooper Union, Feb 1, p 45; June 7, p 37
Co-operative Stove Company, Annual meeting, Feb 8, p 31
Cope, G. W. The stove trade in 1901, Jan 4, p 32
Copper, World's production of, June 21, p 44
Copper floats, March 29, p 39
Copper ware, Retinning, March 15, p 49; 22, p 51
Cork, Polished architectural, May 31, p 54
Corkscrew, Newire, Feb 15, p 34*
Corn grater, Sayres, May 24, p 37*
Cornucopia, Pattern for, June 21, p 64*
Corry, William, June 21, p 43
Cot, Child's folding, April 12, p 39*
Cotton jacket, Universal, June 28, p 44*
Counter for nails, butts, hinges, &c., March 22, p 33*
Coupling, Anderson lead, Feb 15, p 42*
Cover lifters: verses, May 31, p 33
Covers:
Neverslip, April 5, p 40*
Storing pot covers, April 12, p 33
Crane Company:
Buys out the John Schram Company, March 29, p 41
Profit sharing plan, Jan 11, p 36
Crane gas cooking appliances, March 15, p 28
Cream separator, Surprise, May 24, p 37*
Cribben, Henry, Sketch of, Jan 18, p 29
Crop outlook, May 17, p 38

D.

Dayton Cash Register Company, Arbitration, March 29, p 23
Dean, Mark, Heating greenhouses to different temperatures, March 10, p 41*
Defective goods, March 1, p 37; 15, p 35
Deming Pump Company, March 15, p 39
Department of Commerce, Jan 18, p 26
Depreciation, maintenance and interest charges, Jan 25, p 41
Dinner pail ear, June 7, p 36*
Dipper pattern, May 17, p 55*
Dish pan, Pattern for round, Feb 8, p 45*
Display stand, June 21, p 63*
Document case, Fire proof, April 26, p 36*
Doherty, H. L., on fuel gas and gas appliances, April 19, p 34
Doors, Electro plated, March 8, p 62
Doran light, March 1, p 52
Dowman-Dozier Mfg. Company, May 10, p 39
Doyle Air Burner Company, May 10, p 32

Drawback on stamped steel ceilings, Jan 11, p 47
Drawers under show windows, June 14, p 36*
Driven wells for fire purposes, March 8, p 51*
Drum, Heat, Common Sense, March 1, p 33*
Durham system of plumbing, Feb 22, p 52
Dust pan pattern, Feb 22, p 48*
Dynamite disaster in New York subway, Feb 1, p 29

E.

Eave trough, Pattern for, March 22, p 48*
Eave trough end former, March 1, p 41
Economies, Minute, Jan 18, p 25
Edging machine, Automatic sheet steel, Jan 11, p 47*
Education of plumbers in relation to public health, April 12, p 43
Egg beater, Cyclone, March 1, p 35*
Egg cup and cutter, Combination, Jan 4, p 38*
Ejector, Acid well, Feb 22, p 44*
Elbows:
Compound twisted, Pattern for, Jan 4, p 53*
Curved, Pattern for, June 21, p 64*
Excelsior, April 5, p 31
Finding true angles in, June 14, p 55
Oval, Pattern for, Jan 18, p 43*
Springing from pipe, Pattern for, Feb 15, p 45*
Twisted transition, Pattern for, Jan 25, p 36*
Electric heating, April 19, p 41
Electric heating device, May 31, p 37
Electric lamps, Rines incandescent bulb, April 19, p 55
Electric lighting plant and garbage fuel, London, March 29, p 51
Electric motor, Northern, March 8, p 61*
Electric pipe cutting plant, June 14, p 47*
Electric radiator, English, March 22, p 42
Electrically heated devices, May 10, p 34*
Electricity and acetylene, March 1, p 29
Electrolysis, Dayton decision, April 26, p 45
Electro plated doors, March 8, p 62
Elmira, N. Y., Master Plumbers' Steam and Gas Fitters' Association, Letter to manufacturers, Jan 18, p 40
Elmira Reformatory Trade School, March 15, p 48
Emery grinders:
Gem, Feb 15, p 55*
Hero, April 19, p 51*; May 10, p 49*
Empire Iron & Steel Company, March 22, p 47; June 21, p 61
Employees, Pensioning, Jan 11, p 25
Enameled ware, Jan 18, p 32; Feb 15, p 33; April 5, p 39
Enameled ware in England, March 22, p 33
English the world's language, Jan 11, p 48
Enterprise Stove Company, March 8, p 35
Estimating on jobs, Jan 25, p 49
European heating boilers, Jan 14, p 44*
European radiators, March 15, p 37*
Exhaust steam, Removing oil from, April 19, p 41*
Exhauster, A B C volume, March 1, p 45*
Expansion bolts, March 29, p 40*
Export Club of America, June 28, p 37
Export trade:
Cultivation of foreign trade, Feb 15, p 28
Plumbing goods, American representative abroad, April 5, p 45
Suggestions to American exporters, May 24, p 32
Trade of 1901, Feb 1, p 30
United States, June 14, p 32
United States the leading exporter, Feb 15, p 49; May 10, p 36

F.

Factory heating systems, Feb 8, p 41
Failures, Business, in 1901, Jan 11, p 25
Fans:
A B C steel plate, March 15, p 40
Disk, American, May 31, p 39
Large, for mechanical draft, Feb 15, p 39*
Farewell to 1901, verses, Jan 4, p 58
Farm in miniature, April 26, p 50*
Farwell molding machine, March 29, p 25*; June 21, p 42*
Faucet, Removal of, from lead pipe, March 22, p 39*
Feed water and air heater, Keller, May 17, p 63*
Fence, World's Fair, March 29, p 54
Ferracute stamping press, Jan 25, p 35*
Fidelity Pottery Company, June 28, p 55
Filters:
Champion germ proof, April 12, p 32*
Noxall, Jr., April 12, p 32*
Fire from furnace, Cause of, March 22, p 51*; 29, p 50; April 5, p 49
Fire losses, Jan 11, p 26; Feb 15, p 27
Fire pots, April 26, p 39*
Fire proof document case, April 26, p 36*
Fire protection and driven wells, March 8, p 51*
Fires due to electricity, March 1, p 29
Fires in tall buildings, April 12, p 25
Fiske, E. W., Portrait of, May 10, p 31*
Flanges, Roof, Cost of, Jan 25, p 50*; Feb 8, p 48; 22, p 52*
Flue stops:
Clark's Gem, April 19, p 37*
Common Sense, March 8, p 43*
Perfect, May 31, p 36*
Flushing and cleaning small terra cotta sewers, April 12, p 38*
Fly killers, Y-R, June 28, p 44
Food choppers:
Gem, butter grinding nut, March 1, p 38*
Griswold Classic, April 26, p 33*
Rollman, March 1, p 38*
Ruswin cutters, March 29, p 31*
Foot warmers, March 1, p 43
Foreign trade (See export trade)
Foster steam specialties, Feb 15, p 41
Foundry, Melting loss in, March 15, p 48
Foundry costs, March 8, p 62
Foundry iron, threatened famine, Feb 22, p 47
Foundry trade school proposed, April 12, p 35
Freight, Damage to, in transportation, June 7, p 28, 37
Friedley & Voshardt's metal ceilings, Feb 1, p 42*
Frost on windows, Jan 4, p 59
Fruit can wrench, Triumph, March 22, p 34*
Fuel gas and gas appliances, April 19, p 34

Gray Iron Castings. S. CHENEY & SON, Manlius, N. Y.

Excelsior Point No. 6.—PERFECT ADAPTABILITY.

Pea coal, chestnut, small stove or coke may be used as fuel in the Excelsior Ranges. These ranges are made in all sizes from a little 15½ inch single oven range to a big double oven range with a top over five feet long and two ovens each 18 x 20 inches. All sizes are made for either horizontal or vertical boilers and all single oven ranges are made right or left hand. There is no range want that cannot be met in the Excelsior Range line.

ISAAC A. SHEPPARD & CO.
NEW YORK PHILADELPHIA BALTIMORE

Nothing first-rate gets used by the common run of mechanics or anybody else. There is always some plausible reason against it—galvanized iron, for instance.

American Sheet Steel Company
New York

A COAL dealer told one of our customers if he would quit handling STEWART STOVES in that town, he would buy one. He bought one any way. Reasons are obvious.

GREAT FUEL SAVERS are P. P. STEWART STOVES.

ROUND OAK
STANDARD of AMERICA

Why not

among other
good resolutions
for the New Year
make one
about carrying
too many different
kinds of ranges?
Why not concentrate
your efforts on the
Round Oak Steel Range and
Round Oak Standard
Cast Range?
Persistent, continuous,
hard work, with a
good range
to back you up will

show the most profit at the end of the year.

You will not get returns,
however, unless you work,
no matter how good
we make our ranges.
New catalogue ready
about March 1st.

The "Standard" Wickless

BLUE FLAME OIL STOVE.

FOR COAL, OIL OR GASOLINE.

TIME TRIED; it has been in successful use for four seasons and has proven an unqualified success.

It lights quickly, the flame is easily controlled. No joints to leak, is absolutely safe. It is the original and most successful Wickless Oil Stove. For simplicity, safety and perfect operation, is unexcelled.

The following well known jobbers have sold the "Standard" Wickless from its beginning. They recommend it. That guarantees it.

QUICK MEAL

Gasoline Stoves.

"QUICK MEAL" Gasoline Stoves are used in all parts of the World. Their **Name** is synonym of **Perfection.** Their appearance attracts attention. The simplicity of their parts and the workmanship-like manner in which they are made makes it easy for the operator to understand them, easy to regulate, easy to keep clean, and easy to repair.

The dealer who sells the "Quick Meal" makes friends, gives his customers a Gasoline Stove they can't help understand how to handle and one that will bake and cook as well as a range or cook stove. Now is the time to secure the agency for the coming season.

RELIABLE

Vapor Stoves and Ranges.

We have added several new patterns of Vapor Stoves and Ranges to our already large line for 1902, and in the future, as in the past, they will be beyond the reach of all competition. Dealers who handle the **RELIABLE** line invariably control the vapor stove business of their city. They never disappoint the user. Each stove sold will sell another! Testimonials of dealers who have handled them bear witness to their profit-making qualities.

Dealers should write us for a copy of our 1902 Vapor Stove Catalogue. Free for the asking.

FOR WOOD.

Simple, Safe, Durable. Economical in Fuel.

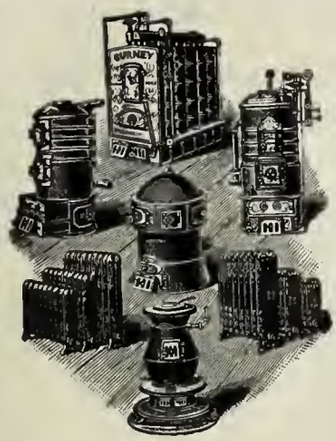
The Best and Cheapest Line of Wood Furnaces. . . .
Furnished for either Brick or Galvanized Iron Casing.

SEND FOR CATALOGUE.

Bergstrom Bros Co

NEENAH, WIS.

The Stanton Seamless Heater,



PORTABLE CASED.

The cut herewith represents the ***Stanton Seamless Heater complete***, with portable casing. The inside Casing Sheet is made of ***No. 24 cold rolled sheet steel.*** The outside casing is made of ***No. 24 Aluminum-coated sheet steel,*** which is anti-rust and will stand a much higher degree of heat than it will ever be subjected to before tarnishing. Heavy asbestos paper is placed between inside and outside casing, which prevents heat from radiating into cellar. ***This coating will not peel off,*** but remain pretty and white.

If It's a Question

of coal consumption or heat production, we can aid you and give you some points worth thinking about.

THE BENGAL FURNACE

burns less fuel and produces more heat than any other furnace its size.

WRITE FOR OUR BOOKLET.

SECURE A BENGAL AGENCY AT ONCE.

FLOYD, WELLS & CO.,
ROYERSFORD, - - PA.

WE HAVE IT

A VERTICAL SECTIONAL STEAM HEATER

WITH A

Steady Water Line

We absolutely guarantee our Henderson Thermo Steam Heater to work with a steady water line with any reasonably good system of piping.

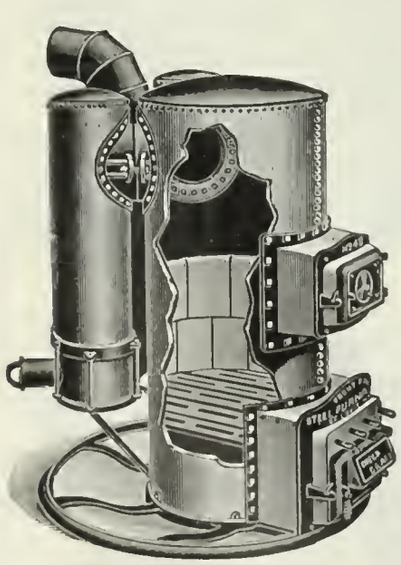
The Prizer-Painter Stove & Heater Co.,

READING, PA.

IF you are not sure what size Furnace to use, tell us the conditions and we will advise you just what size "DIGHTON" will do the work and answer any particular questions you may wish to ask as to size and arrangement of pipes and Registers.

No. of Furnace.	Diameter of Fire Pot.	Height of Castings.	Diameter of Casings.	List Price of Castings.	List Price of Casings.
19	20 Inches	51 Inches	36 Inches	$40 00	$8 00
21	22 "	53 "	39 "	48 00	9 00
23	24 "	51 "	42 "	60 00	11 50
25	26 "	53 "	46 "	70 00	14 00
28	29 "	60 "	52 "	100 00	17 00
30	31 "	62 "	52 "	125 00	17 00

A whole lot of people have written us about how much they paid for a ***name*** and how little the name was really worth to them when the ***goods*** didn't do the work, and how much better and more satisfactory in every way and how much less fuel the "DIGHTON" required to heat the same space.



DIGHTON FURNACE CO., TAUNTON, MASS.

Your Guarantee is Good,

If backed up by our line. We make many kinds and sizes of steam and hot water boilers, and you as a dealer ought to know all about this line. Let us send you our printed matter and post you on the standard line. Write to-day.

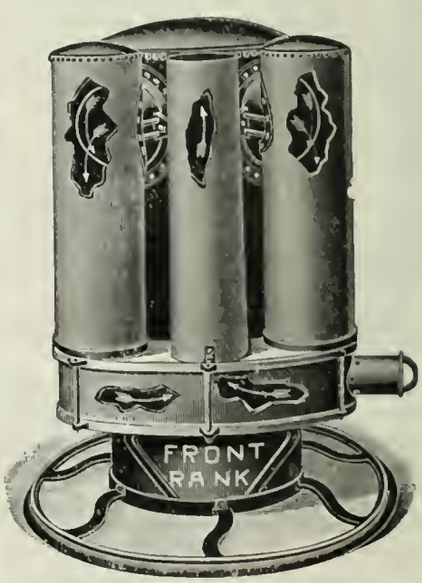
KEWANEE BOILER COMPANY

KEWANEE, ILLS.

Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.



The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

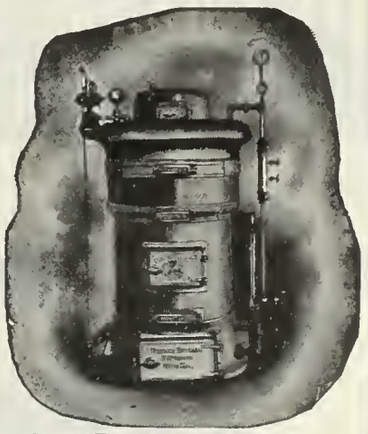
I have had your Time Regulator in use for about two months. I would not take $25.00 for it if I could not get another like it.
Dec. 5, 1901. J. A BENSON, Kirkland, Ill.

Your Time Regulator has been in use for the past two months, and during that time has never failed to work I consider it a purchase which has filled a long felt want. Think no furnace should be without one.
A. S. ROGERS,
Dec. 12, 1901. 6610 Normal Ave., Chicago.

The writer attached your Draft Regulator and up until the present time its operation has been entirely satisfactory.
J. W. CONCHAR,
Of Schrieber & Conchar Mfg. Co.,
Dec. 9, 1901. Dubuque, Iowa.



Your Time Draft Regulator is absolutely reliable. It opens the draft at any desired hour without fail. It is a great comfort and I would not try to get along without it.
P. S. HUDSON,
Dec. 9, 1901. 6618 Normal Ave., Chicago.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

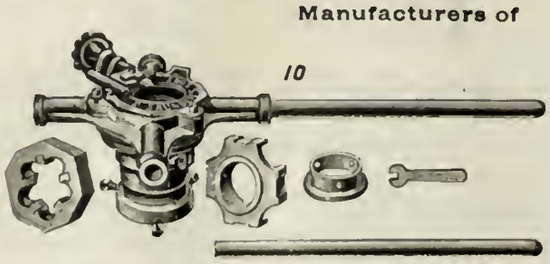
Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.



Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

BATH TUBS and HEATERS.

Why You Should Use a No. 5 Fire Pot

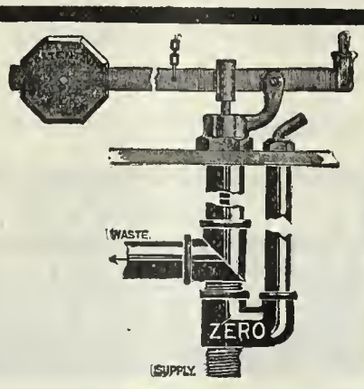
$4.50 NET.

It is light, strong, and can be easily carried.

It produces a strong, blue flame which is intensely hot and free from smoke. The flame can be regulated as the user desires.

A kettle of metal and a pair of coppers may be heated at the same time.

The burner hangs on a swivel joint and can be pointed up or down.



The top section may be removed, exposing THE OPEN FIRE, WHICH CAN BE USED AS A TORCH. The flame then may be applied direct to the point where heat is desired. It is unequalled in thawing frozen pipes, taking soil pipe apart, making overhead or upright joints, flowing bath plugs, or any similar work.

There are many other advantages which will suggest themselves to you.

It requires but little gasoline to do a large amount of work and will save you its cost in a short time in the saving of gasoline alone. When you buy, get the best there is. If it bears our name it means YOUR MONEY BACK IF YOU ARE NOT PLEASED.

Jobbers sell at factory price, or we will ship direct on receipt of $4.50. Our catalog is free. It's worth $$ to you.

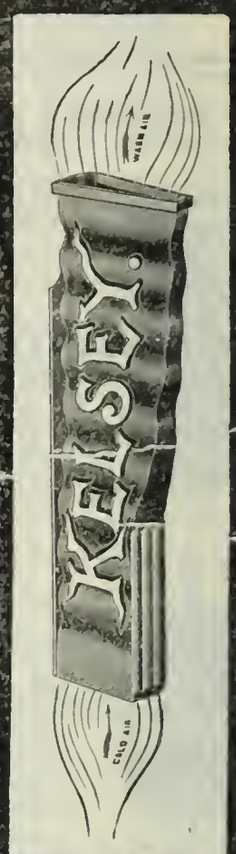
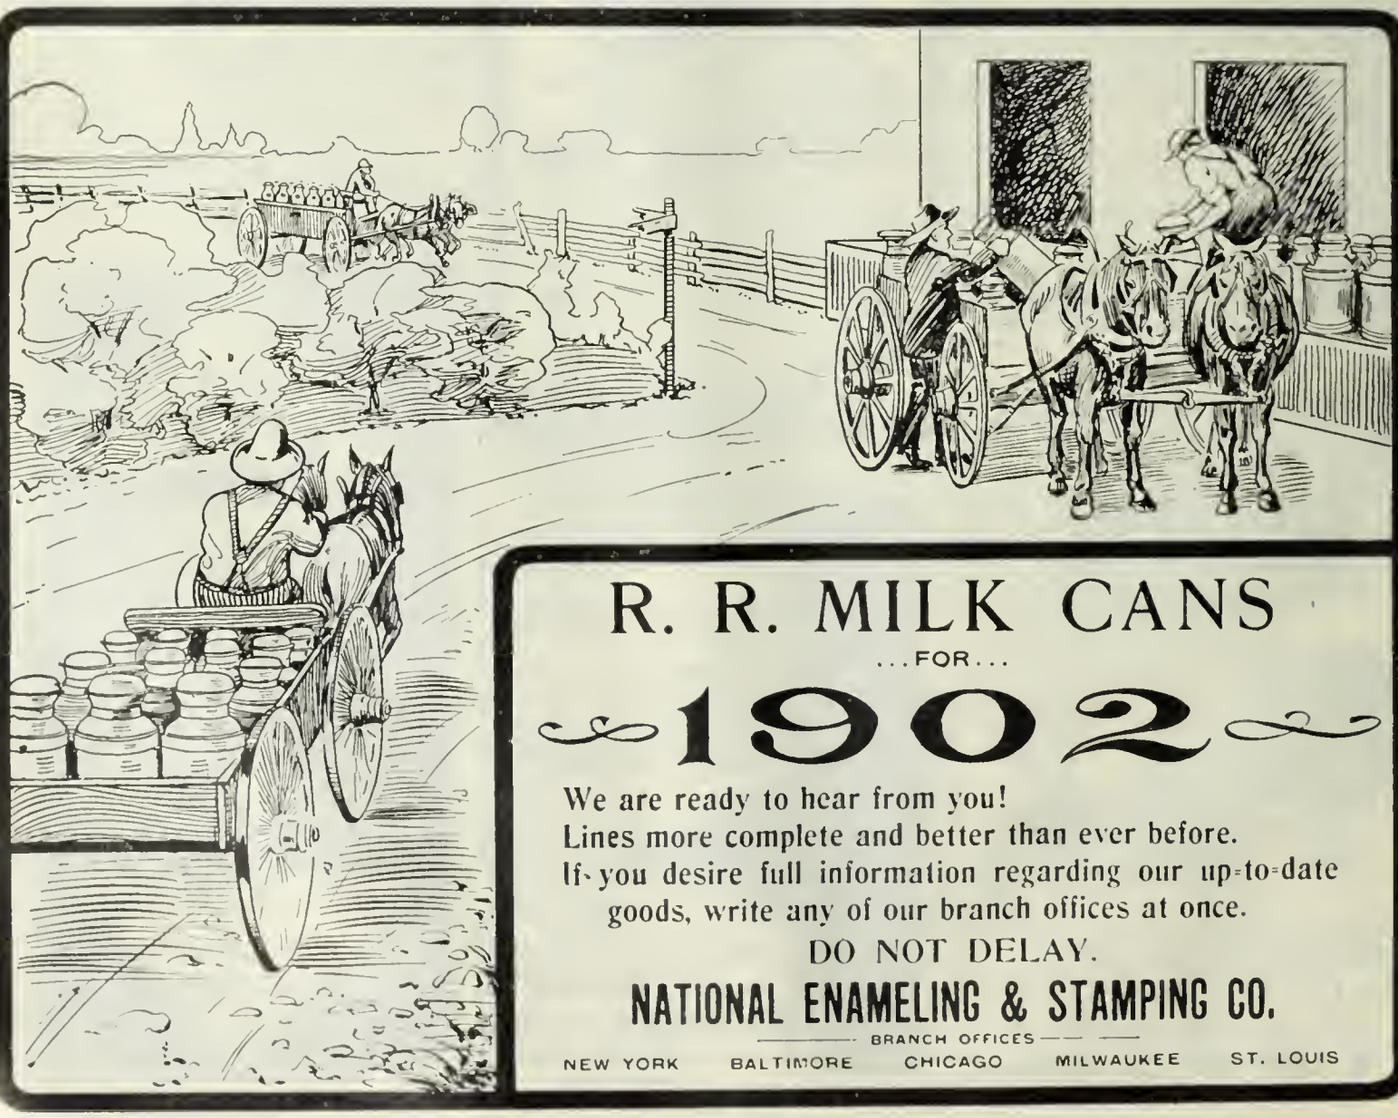
CHICAGO.



The Kelsey Warm Air Generator

Are constructed on the principle of warming the air by bringing it into direct contact with an extensive and properly heated surface.



By sending the air in separate channels ***through the cast iron sections*** which are in direct contact with and over the fire, it is more thoroughly and evenly warmed, than by simply passing over or next to a hot surface.

Send for booklet "Kelsey Heating."

The Outlook for 1902.

The year 1901 will be remembered as a period of extraordinary prosperity in almost every branch of industrial activity in the United States. It is probable that never in the history of the country have conditions conspired so felicitously to stimulate business and provide satisfactory profits to American manufacturers and merchants. While the year just passed more than fulfilled the expectations formed at its opening, there are not wanting those who confidently predict that 1902 will even surpass the record of its predecessor. Indications all seem to point to a continuance of marked business activity during the present year. In the iron and steel trades, in particular, the situation is of the brightest. The demand for all classes of manufactures in this branch has been enormous, and most of the manufacturers of iron and steel products are filled up with orders which will keep their mills busy through the winter months. This is especially true in regard to the heavier finished products, such as steel rails and structural iron, plates, &c., in which the only difficulty is the ability of the manufacturers to meet the heavy consumptive demand. The requirements of the railroads for equipment, in the shape of cars and rolling stock, promises to be by far heavier than in any previous year. With an annual production of pig iron verging upon 16,000,000 tons—by far the largest capacity ever in operation in this country—the available stocks of iron are of the lightest. At the same time the consumptive demand is constantly growing. The only cloud in the sky is the interruption of manufacturing usually now existing by reason of the shortage of fuel, due to the car famine, which is causing serious inconvenience to both consumers and producers of iron, the latter being unable, in many cases, to ship their products in response to orders. It is likely, under these conditions, that the usual winter slacking up in the iron trade will be indefinitely postponed. The demand for the lighter kinds of manufactured iron and steel also continues in large volume. Manufacturers of sheets, for example, are carrying on their books a large bulk of orders which will serve to keep their mills busy and active for some months to come, notwithstanding the fact of considerable additions to the sheet producing capacity having been introduced in the past few months. The same is true of tin plates and of other of the lighter forms of manufactured iron. To sum up, 1901 was a banner year in the iron and steel trade, and its prosperity was reflected to a greater or lesser degree in most of the other trades in which our readers are interested. The outlook for the building industry in 1902 is regarded as of the brightest. A considerable volume of building of all classes is in contemplation, and a great deal of work in this line is already in hand. The activity in this branch of business is not confined to any one section of the country, but, according to reports from numerous quarters, seems to be practically general. The bearing of the activity of the building business upon the trades represented by this paper is important, and holds out the promise of a large degree of prosperity for our readers in the year which has just opened. Reports with which we have been favored, coming from all parts of the country and bearing upon various lines of business, are of a uniformly favorable tone, indicating that business men are looking out with confidence and a large degree of hopefulness for another year of prosperity and satisfaction. In greeting our readers with wishes for a Happy New Year, we feel that we have greater grounds for doing so with confidence than on many previous occasions in which we have been privileged to extend our good wishes at the opening of a new year.

Furnace Heating.

The new interest awakened in the furnace system of heating buildings with warm air gives promise of adding substantially to the already large demand for this staple heating apparatus. It is notable that the furnace system of heating has been selected by architects and their clients for a larger proportion of the fine residence buildings that were erected throughout the country last year than has been the case in former years. This is largely due to enterprise on the part both of the furnace contractor and the manufacturer. Many of the old complaints against the hot air furnace system of heating are no longer tenable in connection with modern furnaces when set up by men who have made a specialty of high-class work in this branch of heating. The modern furnaces are tight and better fitted throughout, while their construction provides for simplicity in operation and management and better control of the combustion than heretofore. Ash pits are ample; grates operate freely, and fire pots present greater heating surfaces, as well as more lasting qualities. The upper structure of the furnace, known as the "radiator," also exposes a large expanse of surface, and promotes efficiency and economy through a long fire travel, so that the available heat is utilized as far as practicable. Those who are devoting their attention to furnace heating are studying the results obtained, and are giving more time to the consideration of the requirements of the buildings to be heated and to calculating the proportions of the apparatus required, thus improving the general character of furnace work.

Architects, owners and furnace contractors, too, have given more study to the subject of ventilation in connection with furnace work. They realize that while the furnace system brings in continually a large volume of fresh and warm air to maintain the temperature in the building, it is also necessary to provide some means for the escape of the air already in the building in order to facilitate the inflow. Various systems of ventilation in connection with furnace work have been presented, and the interest in this feature increases, as it is more fully understood. Those furnacemen who make a study of this branch of work, with a view to stimulating the introduc-

tion of ventilating systems will find an increase of work for themselves, and stimulate the use of this popular method of heating. In modern high-class furnace work larger upright flues and stacks are provided, which is a distinct benefit to the furnace trade.

The work of the furnaceman to-day is greatly facilitated by the practically complete variety of fittings which are produced by manufacturers who have given special attention to producing such goods as will enable the furnaceman to meet the requirements of any kind of building. There is evidence of the furnace taking a more prominent place in the heating of school buildings through the use of fans. From various sections of the country come reports of such systems in use for this purpose and of contracts being awarded for blower systems of furnace heating. All plants of this kind that have been installed tend to demonstrate the fact that the furnace is admirably adapted for the purpose, and that it has peculiar advantages in buildings in which the fire is occasionally allowed to go out in the middle of winter, as it has nothing to freeze or suffer from intense cold. Where the blower system is used the heating is of a positive character, and the slight air pressure resulting aids in the work of ventilation. The furnace system was one of the first central heating systems to become popular for domestic use; and, apparently, after a test of about half a century, it enters upon a new century not only with its prestige unimpaired, but with increasing popularity and improved prospects.

Gasoline and Oil Stove Trade

The season for the sale of coal stoves is hardly over, and they have not yet been removed from their conspicuous place on the sample floor, yet already, throughout the country, the salesman with a line of gasoline and oil cooking stoves is seen. He is prepared, too, in many instances, to supplement an order previously given for oil heating stoves. Information received from the manufacturers of these goods shows that a number of new gasoline and oil cooking stoves are to make their appearance this year, while substantial improvements have been made on lines already popular in the trade. The experience with this line in the past, taken in connection with the new goods for which a canvass is now being made, affords a strong indication that a large sale may be expected for them this year. The popularity of this type of cooking apparatus has become so thoroughly established that neither the hindrances to their use that have been interposed in the past by the insurance companies, nor the annoyance that has been felt by reason of the vagaries in the prices of both oil and gasoline is likely to interfere materially with the demand. Even those coal stove dealers who reluctantly added this style of cooking and heating apparatus to their stock have found it profitable to familiarize themselves with all the details of their construction, and the methods of overcoming the little troubles met with by their customers in their use, and to use some energy in pushing the sale of these goods. While it seems to be yet early for merchants to give any considerable thought to summer goods, the time that is devoted to the salesmen when they appear with their samples and literature of these staple summer goods will be well spent.

Heating Boilers and Supplies.

An effort has been made by the manufacturers of boilers for steam and hot water heating to agree upon a price for their product which shall hold well into the year. At this time there is indication that the prices that may be agreed upon will show an advance over those now ruling, as the manufacturers feel that an advance is warranted by the prevailing conditions. The influence of the boiler manufacturers has also been used to secure a similar action on the part of the manufacturers of radiation, although no evidence of a contemplated advance is manifest in that line. During the past year the manufacturers of boilers have succeeded in maintaining a remarkably steady market. Steam fitters who placed bids early last year were enabled to purchase the boilers when needed at the prices on which they were estimated. This has resulted in a better relation between the different interests in this branch of trade. It seems at the present time that considerable influence will be exerted in the endeavor to establish this relation upon a more lasting basis, so that the steam fitter may place his orders early. This would enable the manufacturers to derive the benefits attending an advance knowledge of the demands that are likely to be made upon them during the year. Having this knowledge they would be able to run their plants on an economical basis and produce stock in such volume as to avoid disappointments and delays in the rush season. The success that has attended the efforts of this branch of manufacturing during the past year lends strength to the influence that is being brought to bear upon manufacturers of valves and brass goods to pursue a similar course.

Reports from all sources indicate that the total number of boilers sold in 1901 was considerably in excess of the highest number sold in any previous year. Those who have watched the outgoing steamers state that hardly a freight steamer left the port of New York during the year that did not have in its cargo a consignment of heating goods, including boilers, radiators, valves, pipe and fittings. Evidently the sales of American heating goods abroad are growing. While less complaint was heard last year than in some other years of inability to get goods when needed, it is claimed that a shortage of stock materially reduced the number of boilers shipped abroad, the foreign orders having been considerably in excess of the available supply. The production of boilers and radiators is likely to be considerably increased during the coming year, through the consolidation of several well-known concerns into one large company, who contemplate the extension of some of their plants and the better utilization of the existing facilities. In another instance the management of a successful boiler house have embarked in the manufacture of radiation and contemplate a large output for the first year.

The enterprise of the heating contractors was reflected in the successful convention of the National Association of Master Steam and Hot Water Fitters, held in June at Niagara Falls. The usefulness of the work taken up by the American Society of Heating and Ventilating Engineers was also demonstrated in the interest taken in the summer meeting of that body, held in Chicago. It is worthy of note that prominent European engineers have been enrolled in the society in sufficient numbers to make a considerable proportion of its membership. The proceedings of the annual meeting of the society, to be held January 21 to 23, will be attended with interest.

The Plumbing Trade.

At the opening of the new year interest in the plumbing trade is found to be active. On the one hand the promise of an excellent year seems already assured, while on the other there are differences to be adjusted between the association plumbers and the makers and dealers in plumbing goods. The travelers who have come in for the holiday season bring reports of enterprise in every section in the planning and erection of new build-

ings, for which the demaud for plumbing supplies, if realized, will keep the producing capacity now available well occupied during what is ordinarily the dull season. It was ouly in the last part of 1901 that shipments in many lines of staple goods become at all prompt, while the demand for some staples is still in excess of the supply, and can only be supplled as goods are produced from day to day. The latter half of the past year was notable for a marked stiffening in prices all along the line of plumbers' supplies. This should be productive of better profits to the manufaceurer. Stiffness coming at this season enables the contractor to make his estimates so as to insure profit on work which he may secure. The only exception to the genceral rule of firm prices that seems in view at this time is on brass goods, which are not unlikely to be affected by the recent slump in copper. It has been asserted, however, that manufacturers of brass goods made little money during the past year, and they claim that maintenance of the present prices would only give them a fair return for their enterprise.

The bulk of the business of the year in plumbing goods was done under a more satisfactory understanding between the manufacturers and the plumbers than has marked some previous years. An Interesting condition was developed in the latter part of the year, however, which has not yet been disposed of. This came from the abrogation of some of the important provisions of the New York Conference Resolutions, which, though ratified with some reluctance by both parties, have been the means of avoiding the unprofitable dissensions which have heretofore marked the trade. At the present time both the manufacturers and the plumbers have adopted a set of resolutions, but as neither has been accepted by both parties, the relations existing in this important branch of trade are not clearly defined. It is believed that an effort will be made to secure an agreement between the dissenting interests which will be mutnally satisfactory. Several meetings of the various manufacturers' associations have been held recently and the mid-year meeting of the Executive Committee of the National Association of Master Plumbers is near at hand. Every influence is being brought to bear by the conservatives in both of the interested bodies to secure an adjustment of the differences and a restoration of the business relations which were satisfactory to a large majority.

The extended use of the most handsome and highly finished plumbing goods has been a feature of the past year which has been beneficial alike to the plumber and the manufacturer, and which is especially gratifying as the indications are favorable for a still larger use of the same character of fittings in the year just opening. Exports of plumbing material have also assumed important proportions. The shipments have been made not only to nearby countries and to the new possessions of the United States, but European houses which were formerly shippers of great quantities of plumbing materials to the United States are now equally good buyers from the United States. The attention which these shipments has attracted abroad, and the fact that displays of American plumbing materials are being made in numerous important foreign centers, bear promise of larger shipments to the same fields. Only a few years ago all of the enameled iron bathtubs and the solid porcelain bathtubs, lavatories and other sanitary fixtures were imported. Now not only have the manufacturers of the United States solved the problem of producing these goods, but through their excellence in finish and greater beauty of form, as well as by reason of their lower cost, these goods are not only being used in greater quantity at home, but are also in demand by foreign buyers.

Roofing and Cornice Work.

Sheet metal has taken a prominent part in the construction of buildings in the last quarter of a century, and the indications all point to its still greater use in the future, owing to its adaptability to the requirements of modern construction work. Advices from many quarters demonstrate a revival of the popularity of tin plates for roofing, due to the improved quality of plates that have been produced by the American manufacturers. It is notable that black and galvanized sheet iron in various forms has proved popular for covering many classes of business buildings and some residences. In the better class of buildings erected by the Government and by private enterprise copper is still held in high esteem for roofing purposes. Now that the price of sheet copper seems likely to reach a figure that will bring it within the reach of a greater number of consumers a revival in the use of this metal for construction work may be expected. Sheet metal lends itself admirably to the production of imitation tiles, and owing to the pleasing architectural effect of these metal tiles those who manufacture them have found a rapidly increasing demand for their product.

For wharf sheds, factory buildings and warehouses sheet metal siding has come into extensive use, and there is no indication of a reduction in the tonnage that will be required for these purposes. The facility with which imitations of stone and brick can be reproduced in sheet metal has led to an increasing demand for this style of siding. The weight of foundations of massive buildings has been very materially reduced through the use of sheet metal for window heads and ornamental cornices and for general ornamental purposes. Whereas in the past the tinsmith was also the roofer and constructed such sheet metal finish to buildings as were needed, the popularity of sheet metal for the purposes above referred to is now sufficient to support large separate shops employing respectively tinsmiths, roofers and cornice makers. It has also brought about the establishment of numerous large works for the construction of special machinery for preparing the materials for use. As a further indication of the trend in this field some of the finest buildings that are to be erected during the coming year will be provided with sheet metal roofs, gutters and conductors, and be embellished by sheet metal cornices and other architectural ornamentations. Sheet metal skylights have also almost entirely displaced all other kinds and their use is extending to new fields, which gives promise that the skylight maker is to share in the work that the new year is bringing to all lines of trade. The use of sheet metal, moreover, has not been confined to the exterior of buildings, but the handsome panel work that has been produced in sheet metal adapts it for ceilings and side walls of buildings of all classes. Not only is a fine artistic effect secured by the original design, but through the assistance of the painter a color effect is also obtained that adds greatly to the demand for this kind of finish for rooms, corridors and halls. Another important quality is that this finish is both fire and water proof, a feature that is not lost sight of in the present effort to erect safe buildings. Its safety and beauty combine to promise a large increase in the use of interior sheet metal work. The workmen will continue to profit by the activity in this branch, where already the demand for those who have a thorough knowledge of every detail in the production of their work is unsatisfied. This should prove an incentive for further effort to master every branch of the trade from the blue print to the finished work in place on the building.

Tinsmithing.

The tinsmith continues to be in active demand in these progressive times, notwithstanding the fact that the drop press and machinery now turn out practically all of the ware and much of the work that formerly occupied his hands, particularly during the winter months. He is now occupied in many lines of work which were practically unknown at the time he was so busy showing his skill and taking such great pride in the finish given to the extensive line of household articles that come under the head of tinware. Those men who have devoted time to the study of geometry and the practice of drawing, so as to enable themselves to cut patterns for any articles that they may be called upon to make, have had no difficulty in keeping constantly occupied and at top wages. Such men are qualified to do any of the work that may be brought to a shop where they are employed, whether in the line of general jobbing work, making dust or other conveyors, blower piping, heating work or the infinite variety of commercial and special work developed by modern demands and for which the tinsmith who can make his work from scale drawings is indispensable. None of the vagaries in decreasing sizes of pipes and elbows with reducing branches at various angles, or the original shapes of commercial constructions, present problems or obstacles that the knowledge and skill of the first-class tinsmith cannot dispose of in a manner that reflects credit upon the craft.

His thorough training as a tinsmith has also qualified him to make a success of any branch of sheet metal work, whether in copper, brass, galvanized iron or heavy sheet iron work for smoke stacks and steel ranges. The indications at the close of the first year of the century are that the new century in its progress will find the tinsmith an indispensable factor, and it is probable that the demands on his skill and knowledge will be greater than in the past. Those who still desire to honor this ancient craft will find it necessary to work with their heads as well as with their hands. It will be necessary to take advantage of the evenings for acquiring a knowledge of geometry and drawing, either from books or in such schools as may be convenient, or by means of the correspondence schools that are available to the craftsman of today. Young men who are ambitious to succeed must adopt some such course, but they should also give close attention to the way more advanced workmen do their work and inquire into it in detail. Tinsmiths who are properly qualified will not become obsolete in the world's workshop, but will continue in active demand at good wages.

The Sheet Metal Field.

Among the interests that secured a full share of the prosperity that marked the year just closed the sheet metal manufacturing industries, especially in the line of tin plates and sheet steel—took a place well at the front. The growth of the use of sheet metals for purposes in which other materials were formerly employed has been very pronounced of late years, and, from all accounts, there was a marked development along this line last year. Numerous articles that formerly were made of wood are now being manufactured largely of sheet metal, owing to the superior lasting and fire proof qualities of the latter, as well as its greater lightness and comparative absence of bulk. The ease with which sheet metal can be stamped and formed up into any required shape by the aid of the improved modern machine tools has materially aided this development. In this connection the prediction is confidently made by one manufacturer that as wood increases in value sheet metal will be substituted, and that in a few years a large proportion of household furniture will be made of it. There is a constant tendency, too, to make from sheet steel a number of goods that were formerly cast or forged. In the line of hardware, such articles as knobs, locks, wrenches, sprockets, wheels, brackets, &c., are now turned out complete in very few operations by presses and dies, thus greatly cheapening, as well as expediting, their production. The rapidly expanding use of sheet metal for architectural purposes, referred to elsewhere, is another marked development of the trade which provides a large outlet for the product of the rolling mills. This entrance of sheet metal into new fields of usefulness is adding materially to the demand not only for sheet steel, but also for sheet copper and brass, and in some instances for sheet aluminum, although the increase in the use of the last named metal has not been as marked as was expected. The high price of copper and brass prevailing during nearly the whole of 1901 tended to restrict the use of those materials to some extent. Nevertheless, the demand for them was of generous proportions.

In spite of the strike that tied up practically the entire tin plate industry for over three months during the summer and closed many of the sheet mills for a lesser period, the manufacturers in these lines have little or nothing to complain of. The demand for both tin plates and sheets was unusually large and steady throughout the past year, and the mills enter upon the new year with well filled order books and bright prospects for a continuance of good business at remunerative prices. The virtual monopoly of the tin plate trade possessed by one great corporation removes that industry to a large extent from the area of competitive business, but it is unlikely that the complete control of the market will remain indefinitely in one hand, however powerful. The movement toward the erection of independent tin mills has already begun, and development along this line may be looked for in the future. The enormous demand for sheets, which was sufficient to keep all the mills busy at their full capacity through 1901, shows no sign of abatement. The sheet mills, both independent and of the combination, enter the new year with all the work they can take care of for the next two or three months, and many with orders for delivery through the first half of the year. These orders are booked largely at present prices, which insures a very handsome profit to the manufacturers. It is estimated that the earnings of the leading interest approximated $1,000,000 a month all through last year. This prosperity was also reflected upon the independent mills. However, there is a large tonnage of new capacity rapidly coming into the sheet market, and these new mills are soliciting orders very aggressively. By July 1, when most of the new mills are likely to be in operation, the productive capacity of the sheet industry will have been enormously increased, and unless the present tremendous volume of consumption keeps up in proportion the supply is likely to exceed the demand, with the usual result attending brisk competition. This is a feature of the outlook in regard to which much uncertainty exists.

Tin plates for all the usual purposes have secured a large sale and the output of 1901 is said, on the authority of an official of the American Tin Plate Company, to have been fully up to that of the preceding year, in spite of the prolonged suspension of operations by the mills. It is likely that the present year will show a large expansion of tin plate production, with a reduction of the cost of manufacture by the introduction of the new and revolutionary process of rolling black sheets that has been adopted by the tin plate corporation. This should

lead to lower prices on tin plates and may possibly be the means of enabling the American manufacturers to open up a foreign market for their surplus product in this line. There is every indication of continued activity in the demand for tin plates through the year, which should be sufficient to absorb the existing productive capacity. Terne plates for roofing seem to have entered upon an era of revived popularity. The demand in this line runs largely to the higher grades of old style heavily coated plates, the merits of which are fully recognized by the roofing trade. The growing consumption of sheet metal for old and new purposes has stimulated the buying of special machinery for working it. Manufacturers in this field have an unusually prosperous year to their credit, and they regard the future with satisfaction. The introduction of new and improved designs in sheet metal machinery has gone along rapidly of late and the makers are keeping well abreast of modern requirements. They are also developing a considerable export trade in their specialties which promises to assume important proportions. To sum up, there is nothing in sight at the present time to hinder an excellent year of trade in sheet metals and the machinery and tools necessary to their manufacture into the many forms called for by modern requirements.

Industrial Consolidations in 1901.

The general prosperity of the year 1900 brought with it a marked increase in the movement toward industrial consolidation, the aggregate capitalization of large industrial corporations in the year just closed amounting, according to a calculation made by the New York *Journal of Commerce*, to the enormous sum of $2,805,475,000. This amount, of course, was materially swelled by the formation of the United States Steel Corporation, with a total capitalization in stocks and bonds of $1,400,000,000. But even allowing for that large sum, the increase over the aggregate capitalization of industrial corporations in 1900 was very marked, being nearly $2,000,000,000. As compared with 1899, it was $140,000,000 over the total for that year. A pronounced feature of the industrial consolidation movement in the past year was a series of heavy increases in the capitalization of consolidations already existing. These increases amounted in all to over $230,000,000. Among the consolidations completed in 1901 were the American Can Company, with $88,000,000 capital; the American Locomotive Company, with $50,000,000; the Allis-Chalmers Company, with $50,000,000; the Federal Boiler & Supply Company, with $3,500,000; the H. W. Johns-Manville Company, with $3,000,000; the United Engineering & Foundry Company, with $5,500,000; the Union Lead & Oil Company, with $15,000,000; the United States Reduction & Refining Company, with $10,000,000, and the great United States Steel Corporation, already referred to. Among the concerns who extended their capitalization during the year were the Amalgamated Copper Company, with an increase of $80,000,000; the American Smelting & Refining Company, with $35,000,000, and the National Enameling & Stamping Company, with $2,500,000 increase.

In connection with the figures for 1901 it should be noted that the aggregate capitalization last year was swollen by a considerable amount of duplication, owing to the fact that consolidations formed during former periods have been merged into still larger corporations. This is particularly true in the case of the United States Steel Corporation, most of the constituent companies of which had already been incorporated in 1899 and 1900. Allowing for such duplication, however, the total capitalization of industrial consolidations in the past three years would still be in excess of $5,000,000,000. The aggregate capitalization of purely industrial consolidations operating in the United States at the present time, after making all allowance for duplication, is placed approximately at $6,500,000,000. As in the previous two years, a number of consolidation projects were started during the past year and carried along to more or less advanced stages and then abandoned. The panic in the stock market in the early summer, and the conditions in the money market which followed, were inimical to the completion of many large financial schemes, and caused the postponement of several large consolidations, having among them an aggregate proposed capitalization of over $1,000,000,000, that were projected. It is likely that some at least of these schemes will be revived during the coming year.

The Board of Directors of the Louisiana Purchase Exposition, to be held in St. Louis in 1903, announce a prize competition, open to the world, for a symbol or emblem for the exposition. The emblem is to be used for the seal, the stationery and advertising matter of every description. An appropriation of $5000 has been made for the same, $2500 of which will be awarded to the successful competitor who submits the prize design, the rest of the money being divided up into honorariums of $250 to each of eight selected artists, and the balance for the expenses of the jury of award. Eight sculptors or artists will be selected to submit designs for the emblem, but in addition to these chosen eight the entire art world, from the newspaper artist to the National or Royal Academician, is invited to participate in the competition. No rules are laid down as to lettering, sentiment, size or style of the design. The only stipulation is that it shall be symbolical of the great historical event which the Louisiana Purchase Exposition is to commemorate, the acquisition by the United States of 1,042,000 square miles of territory from France in 1803, an event which is one of the most important in the history of the United States. A period of six months will be allowed for the competition.

Anthracite Coal Trade of 1901.

The Philadelphia *Ledger* of December 30 sums up a review of the anthracite coal trade of 1901 as follows: The anthracite coal year of 1901 is practically completed, and the estimated tonnage mined and sent to market makes it the banner year for this great industry. The estimate is that about 53,500,000 tons have been produced for 1901, which is an increase of about 8,400,000 tons over 1900 and by far the largest annual product of the trade. Could there have been ample facilities for coal shipment and no car shortage at the mines the market would have taken a much larger output, as the demand for anthracite has exceeded the supply during the latter part of the year. Prices are unchanged, the full circular rates being obtained, and there is no indication of any advance in contemplation by the producing companies.

A London paper reviews the century in a nutshell, as follows: "We received the goose quill and bequeath the typewriter; we received the scythe and bequeath the mowing machine and the self binder; we received the hand printing press, we bequeath the cylinder press; we received the tallow dip, we bequeath the electric lamp; we received the galvanic battery, we bequeath the dynamo; we received the beacon signal fire, we bequeath the telephone and wireless telegraphy; we received ordinary light, we bequeath Roentgen rays."

The manufacturing establishments of Tennessee, according to a bulletin issued by the Census Bureau, increased 75 per cent. in number between 1890 and 1900, the number in the latter year being 8009. Their capital was $71,222,680, an increase of 38 per cent.

The Stove Trade in 1901.

BY GEORGE W COPE.

The stove trade of the past year was of somewhat larger volume than that of the preceding year. Competent authorities are of the opinion that it was at least 10 per cent. larger, taking the country as a whole. Viewed from this standpoint, the year may be regarded as fairly satisfactory. The improvement in trade was not evenly distributed throughout the country, as some sections enjoyed a very much larger business than others. This, however, is frequently the case. It would be remarkable if the conditions prevailing throughout such a large country as the United States would be equally operative in all districts. The West was undoubtedly the most favored in the matter of increased business. It has happened in times of great depression that Eastern trade has shown a degree of steadiness and regularity to which the West has presented a comparison unfavorable to the manufacturers of that section.

The West is peculiarly susceptible to changing conditions, owing to the preponderance of agricultural interests, as Western trade depends so largely on the consumption of stoves by farmers and by residents in towns located in purely agricultural districts. The East, being more thickly populated and depending to a less extent on agricultural pursuits, shows less diminution of trade when farm products are low in prices and agriculturists are discouraged. For the past four or five years the Western farmers have enjoyed abundant crops and have been able to market them at good prices. This has placed the inhabitants of the West in a position of financial ease, enabling them to be heavy consumers of all classes of manufactured goods. The prosperity of the West has caused great growth in its towns and cities, as well as heavy additions to be made to the number of persons engaged in agriculture. Thus a growth in the volume of business has practically been assured, even though peculiar conditions may occasionally have caused some apprehension relative to the maintenance of the demand for manufactured goods.

SCARCITY OF MATERIAL.

The Western stove manufacturers have not found their business entirely free from adverse influences. They have, in fact, had much to contend with, so that their experience during the year has not been one of total freedom from anxiety, and of the steady booking of large orders. They were confronted early in the year by a heavy advance in the price of sheet steel, due to the shortage in stocks caused by the long idleness of the sheet mills in 1900. As so much sheet steel is now used in the construction of stoves and ranges this injected into the trade a disturbing influence. It is always a difficult matter to advance prices immediately to a point sufficient to cover the increased cost of an essential material. Manufacturers are not in every case immediately affected by an increase in the cost of materials, as, for various reasons, some of them are invariably found fairly well stocked The latter are then in a position to take advantage of their less fortunate competitors, being able to supply the trade at old prices and thus secure an enlargement of their business. As the year advanced the scarcity of sheets became more pronounced, and in July a strike was precipitated in most of the sheet mills of the country, which continued for nearly three months and brought about a condition of practical famine in this material. This would have created great trouble in the trade if the largest stove manufacturers had not received ample warning of the possibility of such an occurrence and accumulated a sufficient supply to carry them through this period. Nevertheless, quite a considerable proportion of the manufacturers suffered from the shortage in the supply of sheets and found themselves unable in the fall months to satisfy the requirements of their customers.

DROUGHT IN THE WEST.

Another influence of an adverse character was the great drought which prevailed throughout the West and Southwest during June, July and August and which heavily reduced the crop of corn. The area covered by this drought extended from Ohio on the east to Northern Texas in the southwest and as far north as South Dakota. Thus it completely covered the great corn belt of the country. This drought came at a time when the Western stove manufacturers were securing orders for fall delivery. They naturally feared that their orders would be heavily reduced on this account. Fortunately, however, the sections most affected by the drought had garnered a very heavy winter wheat crop, which was out of the way by the time that the drought began to be serious. This fact, coupled with the excellent financial condition of the Western farmers as the result of several successive years of abundant crops, enabled the people of the afflicted region to continue to purchase such manufactured goods as were needed without regard to the diminution of their year's earnings by the reduction in their corn crop. Thus it happened that what in some years would have been considered a great calamity passed off without serious results and now appears to have cut but a slight figure in the business transactions of the year.

GROWTH OF THE WEST.

Against these adverse influences may be placed the great growth of the West, caused by the abounding prosperity of previous years. Improvements of all kinds were undertaken, not only by railroad companies, but also by manufacturing establishments generally and by individuals. More immigrants settled in the West than had been the case for several years, taking up additional farming lands. Great additions were made to manufacturing towns, and unusual activity was apparent in building operations in all Western cities and towns, as well as in the strictly rural districts. These activities naturally brought with them increased business in the stove trade. Great growth was seen in all classes of heating apparatus, the furnace manufacturers never having had such a year, while the manufacturers of hot water and steam boilers also enjoyed a great growth over previous years. The stove trade was not injured by the growth in these lines, but received its share of the general impetus given to trade.

THE EASTERN TRADE.

The Eastern stove manufacturers enjoyed a fair business as a result of the generally prosperous conditions prevailing among the manufacturing interests. The year was one of activity in all manufacturing lines, and this naturally brought with it such full employment for workingmen that the consumption of stoves was well up to the average. In some sections in the East, particularly in and about New York City, considerable complaint was heard during the year relative to the cutting of prices. This could undoubtedly have been avoided if the manufacturers had arranged for better co-operation with one another and thus preserved more thorough control of trade relations. In other sections of the country no special difficulty of this character became manifest. The volume of business was such as to keep manufactur-

ers well employed. and it was not found necessary to make concessions in order to effect sales. In fact many Western manufacturers at times were unable to keep their customers supplied. The stove trade of the South was not only large, but showed an increase over previous years. The South is steadily improving in its financial condition, and as Southern industries expand and manufacturing towns grow larger the consumption of stoves correspondingly grows. The leading stove manufacturers invariably reported greater activity and larger business during the entire year.

DETAILS OF THE YEAR'S TRADE.

The year opened with only a moderate volume of business in progress. The trade had been well supplied with stoves during the fall of 1900, and the mild weather prevailing throughout the country in January gave no special reason for dealers to make additions to their stocks. The general prosperity of the people caused all manufacturers and dealers to take a hopeful view of the year's prospects and, generally speaking, all were prepared to take advantage of any favorable indication and held themselves in readiness to increase their lines wherever this might prove advantageous. Despite the hopeful feeling, however, the first quarter of the year was somewhat disappointing. Even Western business continued quiet until toward the end of March, when an improvement was noted.

April opened with a better condition of trade in the West, which was due largely to the strengthening of prices in iron and steel. Dealers anticipated advancing prices as a result of increased cost of materials and placed orders more freely, exhibiting a disposition to lay in stocks. The Western manufacturers this month notified their trade that no orders would be accepted for delivery later than July 31, because of the great advances which had been made in the price of sheets and the higher rates ruling for pig iron, which would increase the cost of manufacturing stoves. Before the month had ended the stove trade showed a great increase in volume and conditions began to indicate a banner year. The East felt the effect of these conditions to some degree, but not to as great an extent as the West. It appeared that considerable stock had been carried over from the previous year by Eastern dealers, which naturally prevented them from making further commitments even in placing orders for future delivery. June showed a still greater growth of business in the West, the leading manufacturers reporting that they were having a volume of business at least double that which they had experienced in the spring of the previous year. It should be remembered, however, that this comparison was made with the conditions ruling in 1900 after the great break in the price of wire products had unsettled all lines of trade.

July brought with it a continuance of large busines in the West, but uneasiness began to be experienced early in the month, because of very dry weather, which had continued for some weeks. As the month progressed the drought continued and its effects spread over a still greater area of the country. At the same time the Eastern section of the country suffered from an unusual precipitation of moisture, and caused an equally anxious feeling relative to the agricultural situation in that part of the country. August, however, brought relief from the drought in the West, and although the damage to the corn crop was known to be heavy, much reason for rejoicing was found in the fact that cancellations were few, even from the districts which were most afflicted. A peculiar condition of affairs was reported at this time. Stove foundries located nearest to the drought stricken localities were enjoying a heavier trade than usual, because the dealers who had been impelled by caution to place few or no orders were desirous of securing quick shipments and turned to their nearest sources of supply. The fact was then demonstrated that practically no overbuying had occurred in the West, notwithstanding the excellent condition of trade during the spring months. September brought with it a hardening of prices in oak stoves and sheet steel goods generally, on account of the shortage in sheets caused by the great steel strike. For a time it appeared that prices would be materially advanced on these lines, but instead of this the supply was simply cut down by the inability of some manufacturers to secure stock, and those who were able to supply the trade maintained their prices instead of advancing them.

The closing quarter of the year proved exceedingly satisfactory to Western manufacturers. The weather conditions enabled a continuance of the usual fall trade, not only during the ordinarily broken weather of October and November, but, in good volume, until late in December. Dealers generally were able to dispose of their entire stocks, and in very few cases were complaints heard that they had overbought. Eastern business proved to be fairly satisfactory also, and the year thus closed with manufacturers and dealers in good condition to enter upon the business of the coming year.

An important development in December was the general withdrawal of prices by the Western stove manufacturers, who were impelled to take this step because of the steadily increasing cost of manufacture. This action was decided upon at the meeting of the Western Association of Stove Manufacturers, held in Chicago on the 17th and 18th of the month. As the Western manufacturers have almost invariably taken the initiative in a movement to advance prices, it is to be expected that their action will have a strengthening effect on the prices made by manufacturers in other parts of the country.

PROSPECTS FOR THE COMING YEAR.

It is usual to take a hopeful view of the future. Although general conditions may sometimes make the outlook uncertain, yet, as "hope springs eternal in the human breast," it is natural to endeavor even under such circumstances to extract some degree of confidence. At this time, however, we find no element of a disturbing character either checking the volume of business or threatening to interfere with its healthful growth. The political situation is settled for some time to come, and therefore no danger presents itself of an early change in national policies, always a cause of shrinkage in trade and dampening of enterprise. Our national finances could hardly be in better shape. The currency question, which but a short time since caused so much trouble to the business world, appears to have been permanently settled. Workingmen were, perhaps, never more fully employed than at the present time. Agriculturists are in good financial condition, certainly in far better shape than the agriculturists in any other country in the world. The shortage in the corn crop of last year has been seen not to have caused any special trouble or disturbance, and even the people of the corn belt are apparently purchasing all classes of merchandise as freely as though the crop had been of the average size.

The general condition of the West is perhaps more accurately indicated by the hardware trade than in any other way. As the hardware business for the last half of 1901 was greater than ever before known, and all representatives of hardware houses are exceedingly sanguine of a very good year's business in 1902, it is believed that the stove trade will feel the effect of the benign influences thus demonstrated or indicated. Probably at no previous time have the dealers, particularly in the West, closed a year with such a small stock of stoves as the year just ended. Manufacturers, likewise, have pretty thoroughly cleaned up their stocks, and are in most satisfactory shape to take hold of the coming year's trade. The only thing to be feared is a repetition of last year's damage to any of our important crops; but, as preparations for trade must be made in the expectation that the season will be favorable, such a possibility will certainly have little or no influence on the business coming up during the first half of the year.

STEEL GOODS.

The tendency toward the use of steel construction in stoves and ranges, which has been so prominent a feature of the trade in recent years, made still further progress in 1901. Nearly every stove company are now manufacturing steel ranges, even though the special energy of

the company still may be directed to increasing the trade in cast goods. The inroads made on the stove trade by exclusive manufacturers of steel ranges have caused the manufacturers of cast goods to engage in the production of steel ranges in self defense. The number of steel ranges made during the past year is believed to have shown considerable growth as compared with previous years. The trade in steel cooking stoves, which is of more recent origin, has likewise been marked by rapid development during the year. More of the stove manufacturers added steel cooking stoves to their lines, and this form of construction now seems to have acquired a permanent footing. It had been supposed that the sheet steel air tight stove was an accompaniment of hard times, and that as soon as prosperity returned the demand for this class of stoves would show a heavy shrinkage. This, however, does not prove to have been the case. The trade in sheet steel air tights has been larger than ever, the manufacturers of such goods having secured their share of the increased business of the year. But it has been found that the trade will take a better class of such goods, and numerous manufacturers adopted decorative features or special improvements in design, which added somewhat to their cost. It appears that the air tight stove has so thoroughly demonstrated its usefulness in certain respects that the demand for this class of construction will continue.

CATALOGUE HOUSES.

Considerable complaint was heard during the year among the regular stove dealers relative to the inroads being made on their trade by catalogue houses in Chicago and at other points in the West. These catalogue houses advertised extensively, offering stoves and ranges to consumers at very attractive prices and on easy terms. They sold such large quantities that they were able to make favorable contracts with stove manufacturers, and thus secured extremely low prices. One of the large catalogue houses in the Northwest evidently extended its operations a little too broadly for its capital, and consequently went into bankruptcy during the summer with heavy obligations. Included among the creditors of this house were a large number of farmers and other patrons of the house who had forwarded cash to pay for goods ordered to be shipped to them. This experience has doubtless taught such buyers to be extremely cautious in dealing with establishments of this character. In some of the Western States the dealers placed themselves in a position to compete with catalogue houses. For instance, in a number of counties in Michigan they united for the purpose of buying stoves in carload lots so as to secure lower prices. These stoves were shipped to some central point, from which each dealer drew his quota of the shipment. They were thus enabled to make their customers as attractive terms as were offered by the catalogue houses.

EXPANSION OF MANUFACTURING OPERATIONS.

The excellent condition of the stove trade during recent years has contributed to the healthy growth of well established and well managed stove companies, and has likewise encouraged the establishment of new enterprises in this line. The trade is thus showing a state of gradual expansion, which speaks well for its future. Quite a number of new stove works of moderate proportions were started during the year. These new plants have developed in all sections of the country, thus showing that enterprise is by no means restricted to any one locality. Cities and towns which have long been the seat of operations in stove manufacturing have increased their importance in this line during the past year, and in some instances the expansion thus made has been decidedly marked. The growth in these cases has been due partly to the extension of operations by old companies and partly to the entrance into the field of new capital. No better evidence could be adduced of the healthy condition of an industry. It has been the fashion in some quarters to regard the stove trade as an industry of waning importance, but it is far from exhibiting indications of decay. Its growth is sufficiently vigorous to promise its continuance as an important branch of American industry.

LABOR CONDITIONS.

The stove trade was completely free from any disagreement with molders during the year. The usual conference occurred in March between the representatives of the manufacturers and of the Iron Molders' Union. This meeting was held in Chicago, and its deliberations were satisfactorily concluded on the 25th of the month. The scale adopted was the same as that prevailing in the previous year, and, as usual, was made to cover 12 months, beginning April 1. The provisions of this agreement have been carefully observed by both parties during the year, as had been the case, to the great credit of all concerned, for a long series of years. The relations with other classes of labor in the stove works have not invariably been so satisfactory. Frequent causes of friction developed from time to time, but proved serious in very few instances. It was usually found possible to adjust such differences without causing the suspension of operations. Occasionally a strike of polishers would cause some interruption to regular operations for a considerable length of time, but even in such cases it was found possible to make arrangements by which much of the necessary work would be accomplished. The stove trade was happily free from any labor difficulty which involved the trade as a whole or affected any considerable number of stove works. It is a cause of congratulation to the members of the stove trade that the management of their labor affairs is in the hands of capable as well as energetic men, who have the requisite tact and practical knowledge to enable them to speedily adjust such labor difficulties as will unavoidably present themselves from time to time. No branch of manufacturing activity is wholly free from labor troubles arising from a misconstruction of wages agreements or from attempts to correct fancied grievances.

THE CONSOLIDATION MOVEMENT.

Notwithstanding the failure of all previous attempts to accomplish a consolidation of stove manufacturing interests, another effort was made during the year to effect a scheme of this character. This time the attempt was made by a promoter in Detroit, who secured a number of options on stove plants without evidence of his success becoming actively manifest. The consolidation movement, however, has found sufficient favor to attract the attention and secure the interest of several prominent men in the stove trade.

NECROLOGY.

The stove trade lost quite a number of important members during the year. It will be observed that included in the following list are several men whose names have been identified with the stove business for half a century or longer:

William H. Dwyer, treasurer Peninsular Stove Company, died at Detroit, Mich., January 13, aged 38.

Frank B. Fox, manufacturer of registers and furnaces, died at Cleveland, Ohio, February 4, aged 64.

Charles M. Smith, general inspector Peninsular Stove Company, Detroit, Mich., and a veteran in the stove trade, died in February.

Gen. John F. Rathbone, president Rathbone, Sard & Co., Albany, N. Y., died March 20, aged 81.

Henry Reineke, president Reineke, Wilson Company, manufacturers of gas stoves, Pittsburgh, Pa., died April 14, aged 68.

Reuben R. Finch, vice-president Union Stove Works, Peekskill, N. Y., died May 15, aged 71.

Nicholas Brayer, president Co-operative Foundry Company, Rochester, N. Y., died in May, aged 72.

Joseph C. Henderson, stove manufacturer, Troy, N. Y., died May 10, aged 76.

David U. Cory of Uzal Cory & Co., furnace manufacturers, New York, died July 13, aged 52.

J. Leslie Miller, president Wm. Miller Range &

Furnace Company, Cincinnati, Ohio, died August 13, aged 59.

Chas. W. Adams, former superintendent Chicago Stove Works, died at Virgil, Ill., September 10, aged about 70.

W. M. Shaddinger, former second vice-president Detroit Stove Works, died at Chicago September 20, aged 49.

Geo. W. Walker, president Walker & Pratt Mfg. Company, Boston, Mass., died October 4, aged 74.

Josiah M. Read, pioneer Boston stove manufacturer, died at Everett, Mass., November 6, aged 92.

Theophilus H. Smith, formerly with Magee Furnace Company, died at Chelsea, Mass., in November, aged 84.

John F. Mills, vice-president Abendroth Bros., Port Chester, N. Y., died December 6, aged 58.

Wm. Cribben, Sr., for 20 years foundry foreman of Cribben & Sexton Company, Chicago, died November 21.

SOME HARD KNOTS IN FURNACE PRACTICE.

BY ANTI FRICTION.

It would be beneficial to every man who does hot air furnace work if he would read and study the suggestions in the article recently presented in *The Metal Worker* under the above head, for it contains many useful suggestions. Having had many years' experience in the furnace trade, I have come in contact with numbers of furnacemen who were in trouble, and seemed utterly ignorant of what to do to get out of it. All sought some key to a mystery, which they believed was locked up to them. Invariably I have resorted to an explanation of the very first principles—that is, that cold air, being heavier, falls and pushes the hot air out of its way, and that when in a confined space hot air must rise. This is exactly the condition in a hot air furnace. If there are no restrictions in the air space of the furnace, and no unnecessary obstructions in the air ducts, the air will rise. This may be said to be a fixed law of nature. Another statement that "hot air, like lightning, flows where it meets the least resistance," may be confusing, from the fact that the speed of hot air is much slower than that of lightning. That, however, is the only difference.

At the point where the air leaves the furnace and enters the pipe, there is room for a little study. If a tapering collar 1 or 2 inches long, and having a diameter 1½ or 2 inches greater at the point of connection with the furnace than the size of the pipe used, air would enter the pipes more freely. The pipe would be more nearly filled with air, and the air traveling through the pipe would have a greater velocity. This, however, is expensive, and it is improbable that many people will have their furnace work done on that plan. The suggestions as to location of registers are good. Some men are of the opinion that registers should be located on the outer wall, where, very naturally, there is a falling current of cold air. Other men believe that the registers should be near the inside walls, so that the air can flow from them with the least possible hindrance.

The ideas presented and the suggestions made show that a great deal of time has been spent in observation and study by the author, who, from his writing, seems to be an old furnaceman. The thoughts presented are sound, and can be digested by many younger furnacemen with decided advantage. Such suggestions from practical men in the business are beneficial to all who have opportunity to read it and should be an incentive for more furnacemen to occasionally take up their pencils and present their views where they will have the effect of benefiting the workmen and elevating the character of the work done to the mutual advantage of all connected with it.

Fred. W. Gardner.

The close of the year is usually the time when important changes are made in the management of manufacturing companies. We have grown into the habit of expecting something of this kind as regularly as the flight of time brings us to the month of December. This year announcement is made of a change of far more than ordinary interest to the stove trade. After a connection of fully a fifth of a century with the Michigan Stove Company, as Western manager, with direct charge of the Chicago house, Fred. W. Gardner retires to devote his attention to his private interests, which demand his personal care. This is a long time for a man to be identified with one company, in fact, so long that his name seems to grow into an inseparable connection with it. The period thus covered was one of continuous expansion in every respect. Mr. Gardner has been prominent in the development of the company's business in addition to managing his very important sales department, and he now retires at the end of the largest year's business the company have ever had. He preserves his connection with the company as a stockholder, and is thus deeply interested in its continued success, while the best wishes of his associates in the management follow him in his retirement.

Mr. Gardner has had a brilliant career as a stove man, and relinquishes his connection with the stove trade at a time when his abilities are most widely recognized. In the prime of life, better equipped than ever to grapple with the intricacies of business problems, it is hardly to be expected that he will long remain satisfied with administering his private affairs, even though they may now require absorbing attention. He will be heard from in some new field of usefulness in due season. That success may continue to crown his efforts is the earnest wish of his many friends throughout the length and breadth of the stove trade.

Round Oak's Annual Greeting.

The Estate of P. D. Beckwith, Fred. E. Lee, general manager, manufacturers of Round Oak stoves, ranges and furnaces, Dowagiac, Mich., favor us with a copy of their annual New Year's greeting. This is an exceedingly artistic publication, making a worthy addition to the fine list of similar publications previously issued. The pages are all inclosed in illuminated borders, and the printed matter covers only one side of each leaf, with the tops of the leaves uncut. The frontispiece is a representation of the famous Indian Doe-Wah-Jack lithographed in colors. The tail piece is a handsomely engraved view of the Round Oak Stove Works. The cover is a study in blue, heliotrope and gold.

The letterpress is an interesting presentation of the merits of the Round Oak line. Attention is, of course, first called to the Round Oak heating stove, which has now been before the trade for over 25 years, with its sales constantly increasing. The construction of this stove will not be changed this year. The malleable iron leg, added last year, proved a great success, practically doing away with all breakage. Consideration is then given to the Round Oak steel range and Round Oak standard cast range, which are of the highest class of range construction, and which are made and fashioned after the thorough Round Oak methods. These ranges will continue to be made as heretofore, with the addition to the steel range of a round rolling door to the warming closet and an independent cast iron base to the bottom, making it more substantial, improving its appearance and enabling it to pass through any ordinary house door.

The Beckwith Hot Blast will be a new member of the Round Oak family this year. This stove will have the famous Round Oak one-piece bottom with small ash pit door, which is a positively air tight draft door. It will also have a movable hot blast draft in the top with a new device for raising and lowering the tube so that the draft will be delivered on top of the fire. It will be mounted with Wood's 14-gauge cold rolled iron of the highest quality and with a nickel top ring, nickeled name plates on the malleable legs and a massive nickeled foot rail going completely around the stove. The Round Oak coal fixture will be used, having a rim discharge, preventing the formation of clinkers and securing perfect combustion. The Beckwith Air Tight will be made a much handsomer stove this year than last. Entirely new patterns have been made, which will be decorated with more and richer nickel work. The Round Oak furnace will continue to be made as heretofore with its great one-piece cast top, enabling the suspension of the three flues and cast radiator from this top, thus overcoming the upward expansion which is the cause of leaky furnaces.

TRAVELING STOVE SALESMEN IN 1902.

Black & Germer, Erie, Pa., have arranged with the following staff of traveling salesmen to represent them on the road in 1902 in the territory indicated:

N. H. Tighe in Eastern Wisconsin, Northern peninsula of Michigan and the city of Chicago.

T. J. Duffy, Jr., in Minnesota, North and South Dakota.

E. B. Waterman in Northern Iowa, Western Wisconsin, Minnesota and South Dakota.

D. J. Steele in Colorado, Kansas, Nebraska and Utah.

W. J. Farrell in Southern Iowa, Kansas and Oklahoma.

Arthur Corson in Illinois.

W. S. Jackson in Kentucky, Western Ohio and Southern Michigan.

Frank Thompson in Eastern Ohio and Western Pennsylvania.

D. E. Magee in Indiana, Western New York, Central Pennsylvania and Virginia.

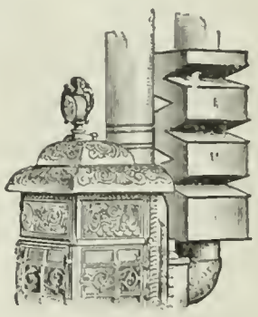
The Ringen Stove Company of St. Louis, Mo., will be the company's Southwestern agents, and the O. K. Stove & Range Company of Louisville, Ky., their general Southern agents.

A Veteran Stove Manufacturer.

In a recent issue of the Louisville *Courier* is found an interesting biography of James S. Lithgow of the Lithgow Mfg. Company of that city, who is now in his ninetieth year. It was just 70 years ago, on December 13, that Mr. Lithgow landed at the wharf at the foot of Third street, in Louisville, to begin his business career. He was born in Pittsburgh, Pa., on November 29, 1812, and had just completed his apprenticeship as a tinner when, in 1832, General Jackson vetoed the United States Bank bill, which paralyzed business in Pittsburgh and elsewhere. His employer entered the shop the day the news reached Pittsburgh and announced what had happened, and, being an enthusiastic Whig, notified the entire force that the country was ruined and that the shops would be indefinitely closed. Mr. Lithgow immediately announced to those present that he was going West, and on the following Sunday morning took passage on the steamer "Boston," which landed him in Louisville, Ky., on Friday morning, December 13, 1832.

Without means, he started out early to look for work, and on the morning of the next day went to work for Bland & Coleman, who ran a tin and sheet iron shop. Subsequently he found employment with Andrew Barnett, who sold stoves and operated a tin shop. His next employment was with Hicks & Taylor. During this employment he became acquainted with Allen Wallace, a fellow workman. During this time James & William McCrum, who were large hardware dealers and handlers of tin plate, had come to know both the young men, and, impressed with their industry, honest bearing and trend for business, suggested to Mr. Lithgow that he and Mr. Wallace go into business on their own account, agreeing to supply them with tin plate and await its being made into ware and sold before payment, and to aid them otherwise financially.

In 1836 the firm of Wallace & Lithgow were organized. By industry and strictest integrity the firm became one of the most prominent and successful in what was then known as the West. Being successful they early established a stove foundry, and in this business—nearly 70 years now—Mr. Lithgow is yet engaged, the name of the concern having been changed some time back to the Lithgow Mfg. Company.



Perhaps no man ever lived in Louisville who was more esteemed or more universally loved than Mr. Lithgow. He has never sought office, although he has at times been forced to serve in official capacity. He was a member of Council and Alderman, and without formal consent was nominated and elected Mayor. Mr. Lithgow has always been a stanch member of the Methodist Church and has supported it with a liberal hand.

E. C. Hanrahan.

E. C. Hanrahan, manager of the Chicago house of the Peninsular Stove Company and one of the most able men in the stove trade, has resigned that position and intends to take a long needed rest. Mr. Hanrahan has been connected with the Peninsular Stove Company for the past nine years. During that time he has had the gratification of seeing the company's business grow to nearly three times what it was when he became associated with them. Prior to this term of service he had been secretary and treasurer of the Schaab-Hanrahan Stove Company of St. Louis, and previous to his connection with that company he had been for many years in the employ of the Bucks Stove & Range Company, also of St. Louis. Mr. Hanrahan has been a hard worker for nearly 30 years, during which time his attendances at stove conventions have been his only vacations. He has been fortunate in accumulating a competence, enabling him at this time to take his ease, and he has therefore decided to retire from the activities of business life. While this is Mr. Hanrahan's present intention, it is the judgment of his friends that, as he is still a comparatively young man, it will not be long until he finds that he has had sufficient relaxation and will feel inclined to again become connected with some active business. He has a wide circle of friends in the stove trade who will regret to hear of his withdrawal from their particular field. Their best wishes will go with him in whatever direction his inclinations may hereafter take him.

The Edgar Radiator.

A considerable amount of heat that otherwise would be lost in the chimney is utilized with advantage by the attachment of a drum or radiator to the smoke pipe

The Edgar Radiator.

of cooking and heating apparatus. In the accompanying illustration we present a view of the Edgar radiator, manufactured by the Welliver Hardware Mfg. Company, Danville, Pa., as used in connection with a parlor heater. This radiator may be attached to the stove pipe and used in the same room with the stove; or, by running the smoke pipe through the wall, in an adjoining room; or, by running the smoke pipe through the ceiling, for heating an upper room. The radiator is made 20 inches high and 9 inches square, and is adapted for 5½ or 6 inch pipe. It is pointed out that the draft is not seriously affected by its use, and the fact that an additional room may be appreciably warmed without burning additional fuel shows that considerable heat is saved from waste and that the radiator is adapted for varied uses. The company issue a circular presenting a number of illustrations showing the various adaptations of the radiator to use.

In keeping with their annual custom the Schill Brothers' Company, Crestline, Ohio, are sending to their friends in the trade a souvenir of the new year in the shape of a calendar with a greeting for 1902. The calendar bears a fine reproduction in colors of a painting by a noted artist entitled "The Raffle." It serves as a pleasant reminder of the Stoves, Furnaces and Ranges made by the donors.

Radiant Home Stoves and Ranges.

We have received from Black & Germer of Erie, Pa., a copy of what is known as "Catalogue E," relating to the Radiant home stoves and ranges, which they manufacture in great variety. Special attention is called to the Radiant Home steel range fitted with the manufacturers' patented air blast linings, by the use of which it is claimed 45 per cent. less fuel is consumed than in cases where these linings are not employed. The linings are warranted for five years, and in connection with a detailed description of their construction a broken view of the fire pot is presented, showing the manner in which the linings are applied. The steel range has a hammered, polished body, a double flue bottom, thus preventing chilling of the oven; double latched spring oven door with malleable iron hinges, removable duplex grate, which when reversed forms a wood grate, and an all cast removable reservoir attachment, which fits all sizes. The range is made in a number of styles and sizes and is adapted for burning as fuel either hard or soft coal, lignite or wood. The cast ranges, which are offered under the name Radiant Home, embody features of construction and ornamentation which have established for them a very gratifying reputation in the trade. The leading place among the heaters is given to the Radiant Home base burner, made in several sizes and offered both as a single and a double heater. The ornamentation involves the judicious use of nickel, while ample mica illumination gives to the stove a brilliant appearance when in operation. Other heaters include the Radiant Home Air Blast, with steel body and also with cast body; the Radiant Home Parlor and the Radiant Home oval wood heater. The catalogue concludes with reference to Radiant Home furnaces, repair lists, index, &c.

ODD PLATES.

A SLIGHT fire occurred on December 28 in the Stove works of Rathbone, Sard & Co., at Albany, N. Y., which resulted in a damage of about $5000. The plant was closed on that day for inventorying and will be reopened in ten days, when the slight injuries resulting from the fire will have been repaired and the works be running as usual.

C. W. REALS has severed his connection with the Keeley Stove Company and during the coming year will represent the Brand Stove Company of Milwaukee, Wis., in Ohio and Michigan.

THE BUCKWALTER STOVE COMPANY, Royersford, Pa., have favored us with one of the handsome embossed calendars for the year 1902 which they are sending among the trade. It is one of the most attractive sent out by the above company for several years, and will no doubt be appreciated by those fortunate enough to receive it.

"THE SUNSHINE STOVE SHOP," Orr, Painter & Co., Reading, Pa., have favored us with one of their pad desk calendars for 1902. Besides its usefulness as a calendar, sufficient space is provided for memoranda. Each page has the announcement of the company at the top, with mention of their various lines of Stoves, Ranges, Furnaces and Heaters.

IT is reported that the Avondale Stove & Foundry Company of Avondale, Ala., have purchased a site and will erect an additional plant to cost $50,000.

ROBERT L. MORLEY, who has for many years been associated with Fred. W. Gardner in the management of the Chicago house of the Michigan Stove Company, was promoted to the position of manager on January 1. The associate manager is J. B. McKewon, who has been connected for a number of years with the Chicago Stove Works as sales manager.

A KINDLY recollection of John E. Gaitley will come to all who receive the neat vest pocket calendar and diary that is being distributed by the Troy Nickel Works, Albany, N. Y. The useful information it contains on such subjects as postal rates, &c., and the maps of the United States territory is amplified for the use of the Stove trade by cuts and descriptions of some of the well-known Alaska Stove Furnishings. The front page of the leather cover is adorned with the Alaska trade-mark in gilt.

THE CHARTER OAK STOVE & RANGE COMPANY, St. Louis, Mo., have favored us with a copy of an illustrated almanac for 1902, which they are distributing to the trade. This almanac presents a variety of contents which will make it acceptable to housekeepers generally. In addition to the usual calendar giving astronomical information for each month, it contains an astronomical chart, forecasting the weather through the entire year. It further presents reproductions of pictures by famous artists and a great deal of interesting miscellany. Interspersed through the contents are illustrations of leading products of the company. It thus comprises in one publication the features of a catalogue as well as an almanac. The arrangement of the contents reflects great credit on the compiler.

FULLER & WARREN COMPANY, Troy, N. Y., have favored us with a copy of the handsome calendar for 1902 that they are distributing among the trade. The monthly sheets are printed in bold figures upon paper of soft tones, with a different color for each month. The sheets are mounted on a gilt card, 11 x 14 inches, bearing in brown lettering the name and address of the company and a reference to their Stoves, Furnaces and Ranges.

HENRY CHATFIELD, who has represented the Standard Lighting Company of Cleveland, Ohio, in New York State during the past six years, will this year look after the interests of the Monarch line in that territory. Mr. Chatfield will represent the goods of the Monarch Stove Company of Mansfield, Ohio, including the Monarch Wickless Blue Flame Oil Stoves, Monarch Gasoline Stoves and Monarch Asbestos Lined Ovens, among the trade in New York State for 1902, doing so under the management of the company's New York office at 284 and 286 Pearl street.

THE CHILSON FURNACE COMPANY of Boston and Mansfield, Mass., are distributing a large sized hanging calender, having the date sheets attached by silk cords to a card on which is a picture of the company's Standard Arlington Range with the name and address of the makers in white on a dark green ground.

A HANDSOME CALENDAR for the new year reaches us from the Phinney Stove Company of 1530 Market street, San Francisco, Cal., who are extensive dealers in Stoves and Ranges, and carry in stock a varied assortment specially adapted to the needs of the Pacific Coast. The main feature of the calendar is a sweet faced young girl set in a framework of violets and gold decoration. The coloring is rich and striking. White scrolls at the right and left, attached by a ribbon of delicate hue, carry the name and address of the company with an indication of the line of business in which they are engaged.

THE CHICAGO STOVE WORKS, Twenty-second street and Blue Island avenue, Chicago, have furnished us with the following list of traveling salesmen who will represent the company in 1902: J. R. Barse, Minnesota and North Dakota; Fred. P. Bloom, Ohio and Indiana; P. J. Coppens, Michigan; Frank H. Leevy, Southern Iowa and Northern Missouri; W. T. Griffith, Wisconsin; F. P. McCarty, Illinois; L. H. Riffel, Nebraska; J. T. Sandven, Western Iowa and South Dakota; W. V. Townsend, Kansas and Oklahoma; W. W. Wilson, Northern Iowa; John F. Cady & Brother, Chicago and suburban towns.

THE annual meeting of the stockholders of the Pennington Foundry & Heater Company, Pennington, N. J., was held last week. The annual report showed the company to be in a flourishing condition financially. The following officers were elected to serve for the ensuing year: Frank Le Bar, president; M. B. Moore, vice-president and general manager, and J. S. Burd, secretary and treasurer. The directors are O. B. Gray, J. R. Bergen, H. R. Sheeler, E. S. Wells, Frank Le Bar and M. B. Moore.

WORK has been begun on a new foundry for the Novelty Stove & Mfg. Company, at Savannah, Mo., to cost $10,000.

THE CALDWELL FURNACE COMPANY are remodeling the plant of the Alabama Hardware Company, at Fort

Payne, Ala., in order to adapt it to the manufacture of Furnaces and Heaters for large public buildings and Iron Mantels and Grates. The building is a substantial three-story brick structure, and was already equipped with a foundry plant when purchased by the Caldwell Company. The necessary alterations will be completed very shortly and the plant immediately put in operation.

The Eagle Steel Range Company of Shelbyville, Ind., have finished the erection of a new building, 50 x 120 feet.

The foundry and Stove plant of Moore Brothers, at Wichita, Kan., is about to be extended by an addition which will about double its capacity.

William R. Yendall, Jr., has been appointed Western manager of the Peninsular Stove Company, with headquarters in Chicago, to succeed E. C. Hanrahan. Mr. Yendall had been assistant manager for five years, and has been connected with the company for a period of 11 years. He is, therefore, thoroughly familiar with the company's line. He also knows the trade intimately, and is therefore well qualified to fill the duties of his new position creditably.

The Detroit *Tribune*, Detroit, Mich., in an article calling attention to prominent business men in Michigan, who would make excellent timber for positions in the cabinet of the President, mentions Fred. E. Lee of Dowagiac. Mr. Lee is well known to the readers of *The Metal Worker* as the general manager of the Estate of P. D. Beckwith, manufacturers of Round Oak Stoves and Ranges. The idea of calling to prominent position in affairs of State men who have displayed genius for the successful management of extensive private enterprises seems to be gaining ground steadily with the people. Mr. Lee has been prominently mentioned for Governor of his State, a seat in the Cabinet and other positions of responsibility and trust. His qualifications for such service to the public, as shown by his management of the great interests which have come under his care, are of the highest order, and if he should be selected for such a position he would undoubtedly fill it with great credit to himself and to the trade in which he occupies so prominent a place.

Arthur H. Lovejoy, who has represented Isaac A. Sheppard & Co. for the past nine years in New Jersey, New York and New England, will represent in New England in 1902 the Fuller & Warren Company, Troy, N. Y., giving special attention to their Stove and Furnace business. Mr. Lovejoy is a practical mechanic and furnaceman of long experience, having paid special attention to the heating of public and private buildings. He has many qualifications that should aid him in making a success with the extensive line of the Fuller & Warren Company in the New England market.

The American Stove Company, recently incorporated under the laws of the State of New Jersey, have increased their capital stock from a nominal figure to $5,000,000.

We are advised that suit was brought on December 16 in the United States Circuit Court for the Eastern District of the State of Michigan by William T. Black and Otto Germer of the firm of Black & Germer, Erie, Pa., against the Art Stove Company of Detroit, Mich., for an alleged infringement in the manufacture of the fire pot of the Twentieth Century Art Laurel. Black & Germer warn the trade that the fire pot used in the Stove named is not of their manufacture.

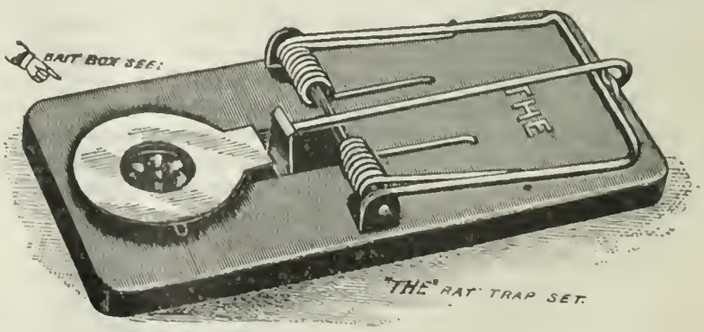
The Galusha Stove Company of Rochester, N. Y., are distributing among their friends in the trade a folder printed in colors and entitled "A Burning Question." It is addressed more particularly to dealers, and calls attention to the merits of Norman Stoves, which are referred to as being made of the best materials and as being easy to sell. Illustrations are presented showing the Norman Steel Range, the Norman Oak and two styles of Parlor Heaters richly ornamented with nickel.

The Reading Stove Company of Reading, Pa., are sending out a neatly printed four-page folder calling attention to the fact that since their 1901 catalogue was issued there have been several additions to the Sunshine line, and some changes in lists. Some of the more important of these changes and additions are enumerated, and accompanying the folder is a handy price-list of things made at the "Sunshine Stove Shop." This price-list consists of 60 pages and covers all the leading lines manufactured by the company named. The matter is arranged in such form as to be of special convenience to the dealer, and in connection with the dimensions and prices are code words which will be found advantageous for use when ordering goods by wire.

The foundry of the Keeley Stove Company, at Columbia, Pa., shut down on Thursday, December 19, for annual inventory and repairs. We understand that operations will be resumed on Wednesday, the 8th inst.

Combination Egg Cup and Cutter.

The Edmonds-Metzel Mfg. Company, 778 to 784 West Lake street, Chicago, have just brought out the Combination egg cup and cutter herewith illustrated. It is intended for table and kitchen use, for handling eggs neatly, whether raw or boiled. It makes a clean cut through the shell and avoids holding the egg in the hand. The device consists of three parts, which are lettered in the accompanying illustration. The egg is



Combination Egg Cup and Cutter.

placed in the holder C, with the small end down. It is next covered by the cap B, which is firmly pressed on the top of the egg and has three needles or projections at equal parts of its circumference which pierce the shell. The cover A is then set on top. This cover has a knife blade, which is forced into the shell, and, the cover being revolved, makes a clean cut through the shell, enabling the top of the shell to be lifted off.

"The" Rat Trap.

J. K. Osborn Mfg. Company, Harrison, N. J., for whom John H. Graham & Co., 113 Chambers street, New

"The" Rat Trap.

York, are selling agents, have just brought out "The" rat trap here illustrated, which in its general character resembles the mouse trap previously introduced. The

base is stamped from sheet steel, gray enameled, and is 3½ x 7 inches in dimensions. The bait box is a concavity for holding the bait beneath the movable pedal, so that the animal must spring the trap in getting at the bait. The coil springs and square loop are of strong coppered steel wire. The traps are packed 12 in a pasteboard box, and 12 boxes, or one gross traps, in a case.

WHAT TO DO IN JANUARY.

BY H. C. W.

The first month of all the 12 to follow—the month of new resolutions—the month of changes and that one which decides for us the result of the inventory as to whether we have made a dollar in the business or see staring us in the face the fact that we have lost many of them.

After closing inventory books, after the dividend, if any, and after closing every possible account on the old books, it is a good time to get ready for

THAT NEW SET OF BOOKS AND COLLECTIONS.

No time is quite so good as the first of the year to start the clerical department entirely new, as to material to be used. There are many good reasons for it. In the first place every one expects to pay his debts, if he pays at all, at that time. It is more convenient for him—as a rule he has more money, and he well knows it is expected of everybody.

This season should lessen by almost hundreds the number of accounts to go into your transfer to a new and clean ledger, and a little printed paster slip put on your statement, to the effect that you are changing, will aid greatly in the collection of them. Something like this, which the writer has used to good advantage:

The New Year is at hand, we expect to open an entire new set of books; will you very kindly help us in this by favoring us with amount of above account?

Many people who would not ordinarily respond, knowing and appreciating the attending labor, will make it a point to see the account paid.

Now, as to your books. If possible at all have them made to suit your wants, particularly ledger and cash book. Many bookkeepers and many proprietors prefer special ruling of ledger, and it costs no more than to buy made up or shelf goods.

In a special column cash book—that is, one in which the columns are ruled for Freight, Drayage, Interest and Discount. Merchandise, Expense, &c.—a great saving in time is made and endless waste of pages in the new ledger are avoided. The matter of simplifying and shortening is a great item where many accounts are carried.

JANUARY THE TIME FOR CHANGES.

There are frequent changes in firms at this season, but the minor changes in store room and arrangement are more particularly referred to. You have, perhaps, more time at your command during the first two weeks of this month for such work than at any other season of the year. It is neither pleasant to the eye nor profitable to keep the same arrangement of your store running from year to year. The appearance of the store must be the loadstone to attract, and customers tire greatly of an everlasting sameness, and are very liable to make the assertion that you are drifting into what is termed old fogyism.

It costs so little to change the arrangement, the placing and filling of showcases and to add new ones where and when needed, and practically just as little for fresh paint and bright, attractive shelving. The addition of a wall case occasionally adds wonderfully to the appearance of a room. Let every effort that is made in this line tend toward the showing of more goods and making the silent salesman. A line of goods such as Hammers and Hatchets or Saws will sell themselves when exhibited in a case, while on the other hand customers will not ask for them under any circumstances unless their errand be directly for that article.

A NEW SET OF RULES

for employees, if your old ones do not meet your views or have not been observed as they should be, or perhaps you have gone along without any.

Men do not object to sets of rules in a store unless they be extremely arbitrary ones—on the contrary, they prefer working under a system that tells them when and where and what to do without the continual asking, and beyond what their own intuition would dictate.

In the case of but two or three employees it may be thought not worth the trouble, but the writer assures you that few or many sensible right lines laid down for their direction are appreciated by the men themselves and the results are greater and much better than where none at all exist.

A little system is a help to the green man and a law to the older one, saving proprietor, too, many moments of anxious worry during the day.

HOW ABOUT ADVERTISING?

Has yours been a success during the past year? Have you bought space and handled it as you would the buying of goods you put on your shelves? Do you get more out of locals than you do out of display, or have you watched the results of either?

Are you using good cuts or putting up the same old ones you have had for years? Do you make frequent changes, and do you confine yourself as nearly as possible to one line of goods in advertising, or jumble many together? In the latter case of course the real object of your work is lost sight of and much of it goes for naught.

We should ask ourselves fairly and honestly these questions and look the matter of our advertising squarely in the face. More money is thrown in the fire through poor advertising and little attention to it than any of us can estimate.

Do you advertise at all? Many Hardware merchants do not. If not, get at it and see the difference in your business. You will wonder where all the barnacles came from that will drop away as you sail along with increased trade.

MONEY IN NEW LINES OF GOODS,

and there is money in them. January is a good time to decide what they are to be. It's very much like your old shelving and your showcases that are never changed as to arrangements and contents; people get tired of seeing them, and in these hustling days are looking for new lines. You will have had continual calls for some one class of goods you do not carry—perhaps House Paints, Box Paints or Brushes—all profitable goods, perhaps more so than you imagine. It takes but little capital to add them, and in doing so it is not necessary to sell the worthless Paints—the man who doesn't pay his debts is a part of every class of trade. You will find there are great quantities of these lines you have not carried, sold all the time and at a good profit and for cash.

Enameled or Gray or Blue Ware is a great seller. Hollow Ware is good, Carpet Sweepers, Fishing Tackle and Sporting Goods in a small way. Put in lines that competitors don't handle; there are any number of them and they attract customers.

LEST WE FORGET,

and what should be the first thing in the new month, don't neglect to see the carried over holiday goods, that positively do not sell during the year, put away safely and put away dust proof and dirt proof. For a great many goods paper bags are capital for this. Some of it can go along through the month with the chance of selling it, but the time comes for Fire Irons, Brass Sets, Candelabra and Candle Sticks, Brass Fenders, Brass Hods and all the smaller pieces of plated, brass and bright goods, and their value gets away unless properly wrapped and bagged and packed in a clean, dark corner.

START WITH A CLEAN STORE.

This month and the new year should see every part of the store spick and span and clean as clean can be. Of course, the inventory helps much if carried through rightly, but all of us do not clean up thoroughly as we go, while it is a fact that every man doing calling off should have a brush or feather duster near at hand, and not depend so largely on an after going over, for which time and opportunity may never come.

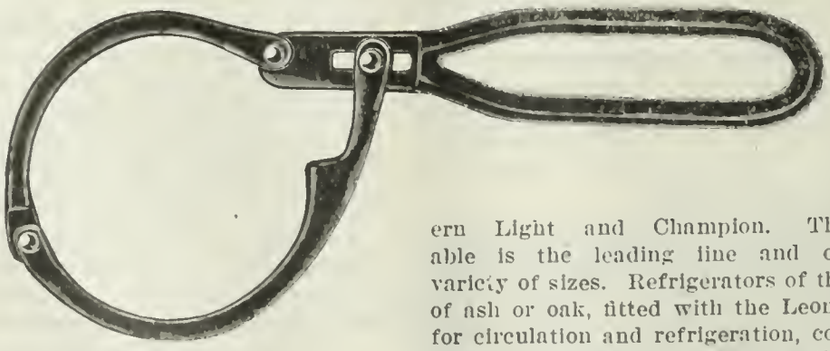
It is wonderful the amount of filth, &c., that gathers during the year on shelves, in boxes and throughout

every corner of a Hardware store, and the time to clean up rightly is early in the first month of the year.

THE OPPORTUNITY FOR CLEARING DEAD STOCK

is in January. No other month gives you the same, and in no other month of the year, perhaps, is there as much time to give to it. If inventory has been rightly taken it has developed all the worthless and unsalable goods in the house. It now remains for us to get rid of them, and with many this is a sort of nightmare, while properly handled and displayed it is not a hard job at any time. Give them a table of their own; show them at their best, with a price that will move them, and if that price don't do it give them another. Lump them off to contractors, shop men, factories or what not. Sell them at some price, and you will have done the best job of the month, leaving you in good shape for the 11 months to follow.

Side Cutting Long Nose Plier No. 622.



The Smith & Hemenway Company and the Utica Drop Forge & Tool Company, 296 Broadway, New York, are putting on the market the side cutting long nose plier herewith illustrated. The advantages claimed for the plier are that having a long narrow nose it can be used in deep, narrow quarters in which an ordinary tool would not work; that it will do the work of a regular tool and that it is convenient to carry. Every tool, it is remarked, is carefully tested at the factory before being sent out. The plier is referred to as being adapted to the use of telephone manufacturers, machinists, engineers, electricians and jewelers.

Side Cutting Long Nose Plier No. 622.

The U. S. Mason Jar Wrench.

C. A. Powell, 387 Kinsman street, Cleveland, Ohio, is offering the Mason jar wrench herewith illustrated. It is described as being constructed on the lever principle, designed to give an absolute grip and an equal pressure around the cover by means of an adjustable device. The handle is so connected to the claws or rings, it is explained, as to compress them with just sufficient force to overcome any tendency to slip, and yet not grip the cover with more pressure than is necessary, thus obviating the risk of cracking the glass or crushing the cover. It is pointed out that the wrench grips the cover around the top, so that the pressure is sustained by the glass disk, making it impossible to crack or break the jar. It is claimed that with the wrench a jar can easily be sealed air tight, and that no matter how tightly the cover may stick, it can be easily removed without prying under it with a knife.

The U. S. Mason Jar Wrench.

The Eureka Step Ladder.

The step ladder shown herewith is offered by John S. Tilley, Watervliet, N. Y. The ladder has a special style of hinge, connected front and back, bolted on, rodded and well braced with iron braces. The ladder is also made with the open back, as shown in the detached cut to the right, which is preferred, it is stated, by most painters, as it admits using a plank to make a platform more readily. The ladder is also made with a pail rest. The manufacturer explains that the ladder is particularly adapted for painters, carpenters, fruit pickers and mill use, or in fact wherever a durable step ladder is required. It is pointed out that the ladder fills all the requirements of a first-class article, and is not cumbersome. It is made in eight sizes, from 5 to 12 feet, in even foot lengths.

The Eureka Step Ladder.

Grand Rapids Refrigerator Company.

Grand Rapids Refrigerator Company, Grand Rapids, Mich., have issued a new season's catalogue of the Refrigerators manufactured by this company under the names of the Leonard Cleanable, Northern Light and Champion. The Leonard Cleanable is the leading line and consists of a great variety of sizes. Refrigerators of this style are all made of ash or oak, fitted with the Leonard patented system for circulation and refrigeration, constructed with eight separate and distinct walls protecting the contents from the outside air, and have the Leonard patent Refrigerator lock, the Leonard patent method of interior construction, the Leonard patent ice rack, the Leonard patent sliding adjustable shelves and the patented method of enabling the entire interior to be removed to permit the flues to be washed. The Leonard Cleanable also includes numerous elaborate sideboard constructions. A number of sizes are furnished with a lining of genuine porcelain instead of zinc. The Northern Light line is provided with a removable ice tank among other special

features. This line is made in special styles, comprising the standard sizes. The Champion line is more extensive than the Northern Light, and is presented to the trade as a well made Refrigerator at a lower price than the Leonard Cleanable.

The American Rotary Washer.

The accompanying cut represents a washing machine offered by the Bluffton Mfg. Company, Bluffton, Ind. The motion is referred to as a departure from all other rotary motions. The gear is represented as the strongest leverage known and the operation of the washer as the easiest. Strain of castings is not known in this gear, it is remarked, hence breakage is eliminated. The machine has a locking hinge gear, which locks it when open or closed. When opened the gear raises the lid, bringing it to a position far from interference with loading or unloading the machine, and giving ample room for use of the wringer. It is pointed out that the speed is fast

The American Rotary Washer.

and that the rotation of the pin wheel is with a large sweep, causing great agitation of the water, which is the factor that cleanses clothes. The manufacturers state that the machine is of the highest quality throughout and the finish of the best.

North Star Refrigerators.

The Indiana Mfg. Company, Peru, Ind., are sending out catalogues of the North Star refrigerators. One of these catalogues, consisting of 56 pages, presents illustrations of the full line, comprising constructions intended for every requirement of domestic use, beautiful sideboards and large sized refrigerators for grocers, butchers, &c. The North Star Refrigerators embody an efficient method of securing the circulation of air, and the insulation is accomplished by a combination of dead air space and granulated cork. These Refrigerators have seven walls. The ice rack is of new design and made entirely of galvanized steel. The trap is ingeniously constructed to serve the purpose for which it is designed. A portion of this catalogue is devoted to the illustration of tile lined Refrigerators, the company making a very complete line of this class of Refrigerators. Several pages are used in presenting illustrations of the Indiana hard wood Refrigerator, which is a first-class construction furnished at a lower price. A second catalogue treats exclusively of tile lined Refrigerators. The illustrations of this catalogue are of a specially high order of merit. The shelves, pipe, top of provision chamber and door bindings of these Refrigerators are finished with four coats of enamel thoroughly baked on. Shelf tiles are used for shelf supports, making a very much better finished interior.

The Twentieth Century Tack Pullers.

The Henry & Wright Mfg. Company, Hartford, Conn., are offering the tack pullers shown in the accompanying

Fig. 1.—Twentieth Century Tack Puller No. 1.

illustration, which are one-half the actual size of the goods. They are designed to overcome certain imperfections which are referred to as existing in wooden handled pullers. The handles of the pullers illustrated are made of iron with japanned finish. The hardened jaws of the pullers are firmly riveted to the handles, thus making them practically unbreakable, if used only for pulling tacks. It is pointed out that they also have the advan-

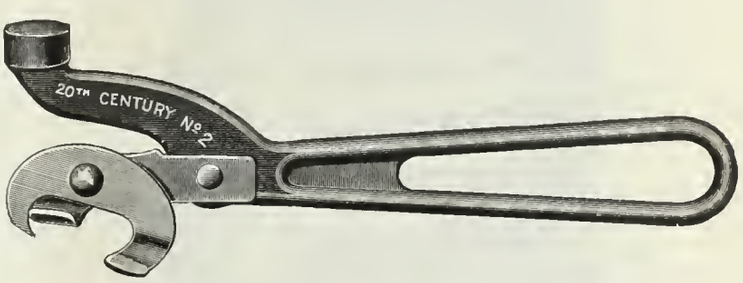


Fig. 2.—Twentieth Century Tack Puller No. 2.

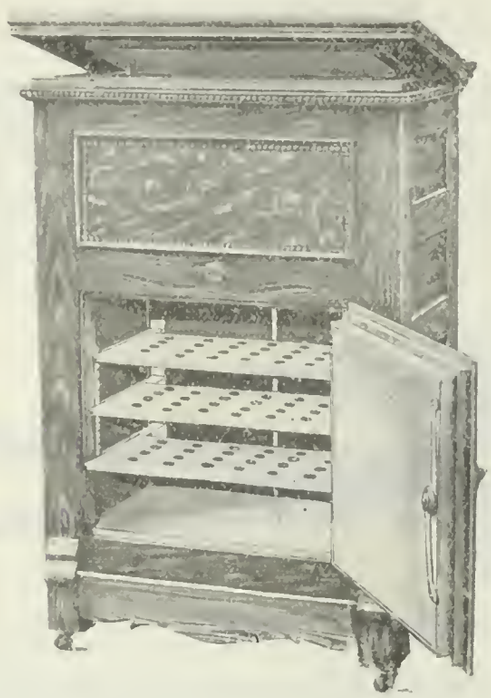
tage of taking up little space, and that they are light enough to make them convenient articles for mail order trade.



The Adams & Elting Company.

The Adams & Elting Company, manufacturers of Paints, Chicago, have brought out three interesting catalogues descriptive of some of their Ad-El-Ite specialties. One catalogue treats of Iron Bedstead Enamels, showing samples of 21 tints. These Enamels consist of Art Lacquers of dead finish and Enamels of gloss finish. The Lacquers are stated to dry perfectly hard in half an hour, presenting a finish which cannot be chipped, washed off, nor glossed up with rubbing. The Enamels are furnished in many tints and cover thoroughly in one coat except the very delicate tints, which require two coats. These Enamels dry perfectly hard in 12 to 14 hours and can be baked at 150 degrees. The second circular relates to tinted Enamels, which are shown in 18 tints and are adapted for application to any surface, such as walls, furniture, iron beds, radiators, lawn chairs, or interior finishing of houses. The third pamphlet is intended for the information of consumers of Paints and gives many practical suggestions how to refinish the interior and exterior of a home and improve the appearance of the contents generally by the use of the Ad-El-Ite specialties.

Sidney, Shepard & Co., Buffalo, N. Y., are distributing a leaflet illustrating and describing their Perfect Galvanized Washtubs with corrugated steel wringer attachment; also their Gilmore Grater, which they claim will not clog, because from the shape of the perforations, the article to be grated is cleanly cut, and the cuttings drop through directly without lodging in the holes.

The Leonard Sliding Adjustable Shelves.

An illustration is presented herewith of a new feature which has been incorporated in the Leonard Cleanable Refrigerators by the Grand Rapids Refrigerator Company, Grand Rapids, Mich. The company state that for 20 years they have felt the necessity for a sliding adjustable shelf, but had never been able to make it until this arrangement was devised. Sliding shelves have been arranged in ovens and adjustable shelves in bookcases, but until this time a sliding shelf has not been brought out which is also adjustable to any hight without the aid of tools. By means of this new arrangement any one can place the shelves at any desired hight in the refrigerator by simply changing the guide strips from one slot to another. They are not fastened by screws or locks of any kind. The close adjustment enables extra shelves to be

The Leonard Sliding Adjustable Shelves.

inserted for small articles, such as pies, thus increasing the capacity of the refrigerator by one-third without extra cost for the additional space.

Stove and Hardware Dealers.

Curtis & Wellington have moved into their handsome new quarters at 366 Stratford avenue, Bridgeport, Conn. The new building is carefully planned and fitted up to meet their requirements. On one side of the store is a display of Cooking Ranges, House Furnishing Goods and Agate Iron Ware. On the opposite side is a sample room of the Thatcher and Boynton Hot Air Furnaces. In the rear of the office is a fine showroom fitted up for the display of Plumbing Fixtures. The building extends back to a driveway over which there is a shed, so that teams can unload directly into the shed. The shops are in the basement equipped with benches and machinery for sheet metal work, plumbing and steam and hot water heating.

Hardman & Leatherman and Shirley Bros., Orleans, Ind., have consolidated their interests under the style of the Orleans Hardware Company, who have been incorporated under the laws of Indiana. The line carried by the company embraces Hardware, Implements, Stoves, Building Material, Wagons, Buggies, &c.

Frank L. Jones, Utica, N. Y., has issued a new pricelist of apparatus, supplies and specialties for cheese factories, creameries, dairies, milk stations, milk dealers, &c., of which he is manufacturer.

The Winfield Mfg. Company, Warren, Ohio, are distributing a circular illustrating and describing their Anchor Sap Spout, which they have been making for 15 years.

Maine Mfg. Company, Nashua, N. H., have prepared an attractive poster calling attention to their White Mountain Refrigerators. The company are prepared to furnish the posters in liberal quantities to their customers, printing firm name and address in the margin at the bottom.

Randallman & Sons, manufacturers of the Gee Whiz Washing Machines and Wooden Novelties, Des Moines, Iowa, will erect a new building early the coming spring, which will double the capacity of the plant. The factory was located in Des Moines a year ago, and the business of the company has been steadily growing since then.

A tasteful wall calendar has reached us from the Grand Rapids Refrigerator Company of Grand Rapids, Mich. It consists of an artistic picture of red and yellow roses in a bowl, displayed on a golden ground and having small calendar sheets attached to the bottom, the whole presenting a fine decorative effect. An unusual feature of the calendar is the fact that the front part contains no advertising matter whatever, not even the name of the concern being printed upon it. All the advertising matter is at the back, and consists of illustrations of the new Leonard Cleanable Refrigerator for 1902, closed and open, with a description of the merits of this article. The Refrigerator is offered in two styles, one zinc lined and the other lined with porcelain. The company note that their new catalognes for 1902 are now ready, and that they will be glad to send a copy to any one in the trade who has not yet received one.

An interesting decision was recently handed down by the Recorder of the city of Leeds, England, in a case brought against an employee for the alleged theft of trade secrets. The man in question was charged with stealing eight acetylene gas burners and other property belonging to his employers, who are the patentees and manufacturers of the burners. The man had been in the employ of the prosecuting firm for three years, and there was an unwritten understanding that he was not to divulge any of their trade secrets. He left their service, and entered that of a rival firm in Scotland, taking with him, without consent of his former employers, certain articles which he had used to carry on in his new employment a process identical with that used by his original employers. The prisoner affirmed that he was simply experimenting with the appliances which he claimed he had removed by inadvertence. The Recorder, in passing judgment, said that the issues of the case were of the utmost importance to the commercial community. A man might steal his employer's brains, but he could not legally take away his property against the employer's will. The prisoner, being found guilty, was sentenced to nine months' imprisonment at hard labor.

Evans Stamping & Plating Company, Taunton, Mass., have purchased the entire plant of the Draper Williams Mfg. Company, manufacturers of Oil Cans and Awls. The Evans Company have moved their steel making department, which was formerly in the Taunton Iron Works, into their new plant, and will continue the manufacture of Nickel Plated Steel Stove Trimmings, which they have been making for the past four or five years. They are also getting ready to manufacture an Oven Thermometer, for which they have secured the patent rights. They will probably be ready to put this Thermometer on the market about February 1. They also intend to manufacture a full line of Stamped Steel Hardware, including Oil Cans.

Frederic G. Dow, who was a director of the American Stove Board Company and of the U. T. Hungerford Brass & Copper Company, and was also interested in a number of other industrial corporations, died on December 28, at his home in New York City, aged 51 years.

In addition to practically monopolizing the ice business of the East, the American Ice Company, it is said, are planning to enter the coal business on an extensive scale. The concern evidently want to get all that there is going both winter and summer.

THE PROTRACTED ACTIVITY IN THE IRON TRADE.

The iron trade is now entering upon its fifth year of activity. It will be remembered that, when the revival in the demand for iron and steel began to make itself felt in 1898, some exceedingly sanguine members of the trade quite confidently predicted that the country was destined to see at least five years of prosperous conditions. Their roseate view of the future was received with considerable skepticism. The trade had grown accustomed, by quite a train of peculiar experiences, to believe that no betterment in demand and prices could possibly be of a protracted character. It was assumed that our capacity for production could be so easily expanded whenever necessary that if at any time an excessive demand would spring up the supply would overtake the demand so speedily that the trade would soon relapse into its condition of unsatisfactory returns to those engaged in iron and steel production.

Looking back over the immediate past, it is now plainly seen that the most optimistic views entertained in 1898 have been fully verified. These five years have been an eventful period, inasmuch as it has covered a foreign war, the development of a great export trade in iron and steel and other manufactured products, a boom and its collapse, some serious strikes, the assassination of a President, the failure of crops in some important agricultural sections, and occasional disturbances in the stock market, which, for a time, caused considerable apprehension. It appears now that the foundations for a long term of prosperity were very deeply laid and very broadly built during the severe depression from 1893 to 1897. During that time of privations and struggles for existence the manufacturers of the United States were taught more valuable lessons in economical management and in the introduction and application of cost saving appliances than they had ever before learned. The establishments which were able to pass through that trying period and find themselves at its close in perfectly solvent condition, with well equipped plants, and perhaps with command of supplies of raw materials, were in a position to take instant advantage of improved times and to greatly increase their strategic position. The opportunity was also grasped for the formation of large organizations, projected by far seeing men who only needed the backing of capital to enable them to make combinations which they realized would have an enormous advantage in conducting manufacturing operations. Out of these circumstances grew the tremendous advance made by the manufacturing interests of this country during the past five years.

During the period thus under review experienced business men have almost invariably been moved to exercise extreme caution whenever an occurrence of an adverse character has happened. They have permitted their experience under previous conditions to lead them to believe that every check to business activity marked the beginning of a protracted downward course of prices. On no less than three occasions in the past three years have wise men of the iron trade been thus deceived. To the surprise of the majority, the year just ended has passed out under conditions marking the greatest activity yet known. It had been expected that by this time the iron trade would surely be on its downward course. The great falling off in iron and steel exports during the year was one of the influences which it was felt would lead to overproduction if the iron trade should again be obliged to depend solely on domestic markets. The growth of domestic consumption to such a point as to require not only every pound of pig iron and steel produced in this country, but also some foreign material, is a most surprising development. It is one of the marvels of the times. All the increase in capacity during the year has not been sufficient to cause any disturbance in the markets except in the wire trade alone, and in this trade the volume of business has been so large that no serious results have followed from the increasing competition, the recession in prices having been gradual instead of abrupt. It may be said, therefore, that in every line prosperity and full employment continue to be the rule.

The question uppermost in every mind is, How long will this condition of affairs last? From present appearances it will continue until some financial upheaval again destroys confidence, production overtakes consumption, or farming interests suffer from some greater calamity than that of last year.

There is a feeling in financial circles that a very large volume of new issues has been placed on a market whose power of absorption, wonderful as it is, has been greatly taxed. While a good deal of capital has merely shifted, an enormous amount has been put into undertakings which cannot very well be immediately productive. Speculation has suffered some defeats, notably through the pricking of the copper bubble, and there has been some uneasiness in other lines, but on the whole the situation is regarded as essentially very sound.

On the question of a possible early oversupply in the iron and steel trades all doubts are now at rest, at least so far as the first half of 1902 is concerned. In fact, the problem of the moment is rather how to satisfy legitimate demands, there being absolutely no speculation. Our annual reviews, printed elsewhere, deal in detail with the amount of work under way to provide for further expansion of product. There is hardly a concern of any importance in the country which is not enlarging and improving, and there has been some very remarkable work in progress in bringing the plants of the great steel corporation to a higher standard of efficiency. A good many more independent concerns, large and small, have been started, so that not only is the capacity enlarging, but it is also greatly improved in character. In other words, we shall be able to make in 1902 more iron and steel, and cheaper iron and steel, that we ever have done.

Prices, while undoubtedly remunerative, are not so high as to check consumption at home, although they are altogether, for the time being, above the world's level of values. Of course the time will come when we must again seek foreign markets, and then we shall have to be content with much lower returns. But we shall then be very much better equipped to secure a large share of the world's markets. The best opinion in the American iron trade is that this test of strength will not come in 1902.

Nor must it be forgotten that every addition of modern plant in the iron and steel industries in this country, every one of the notable reductions in cost now being achieved, means the displacement of capacity now active in foreign countries. A group of great new furnaces in the Central West, a new steel plant on the Lakes, means that some toddling old furnace in the Black Country, some old puddle mill on the Continent, will soon be forced out of the business. There is a tremendous amount of antiquated manufacturing capacity ready to wander to the scrap heap. Our expansion means more now than it did when we were fighting for our home markets alone. It means that business long held abroad by those who are decrepit and superannuated must go to the new plants of the United States. We have an enormous amount of work before us and need not be frightened because we cannot see an outlet for our products at our immediate doors.—*The Iron Age.*

After inspecting statements showing how many millions of dollars the Iowa farmers have "cleaned up" this year, we understand, says the Minneapolis *Journal*, why there are no large cities in Iowa. The farmers can use the ground to better purpose.

An engineering contemporary says that the best way to harden a steel tool for a special purpose is to heat it to a cherry red, drive the point into a cake of lead, and leave it there until it is cold, when it will be found to be hard and tough.

The following cheap way to blue small pieces of steel is recommended by a contemporary: Put core sand in a babbitt ladle; heat hot; put the work in and shake the ladle over the fire until the required color is obtained.

European Heating Boilers.

BY CHARLES F. HAUSS.

IN THREE PARTS. SECOND HALF OF PART THREE.

In Figs. 110 and 111 is shown a hot water heater of novel construction, made in England. This heater is especially built for heating water in large quantities for baths or for domestic supply where the water carries and is liable to deposit on the heating surfaces large amounts of sediment or scale. To be able to easily remove this sediment or scale, the maker provides seven clean out openings, of which one is at the top, one each at the front and back and four around the bottom of the water way, all covered with bolted plates.

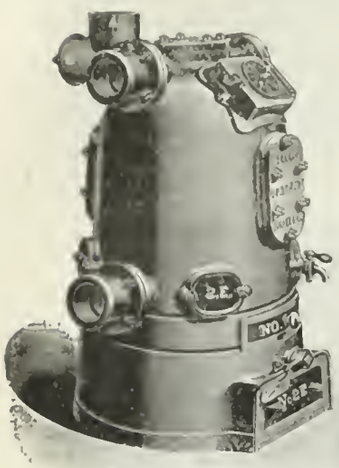


Fig. 110.

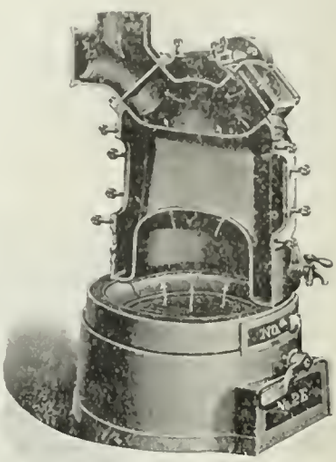

Fig. 111.

Fig. 112 represents a very large sectional boiler made by the same English manufacturer. The peculiar arrangement of the fire surface, and the introduction of air back of the bridge wall to aid in the proper burning of the gases, are the special features claimed for it. The sections are joined together by four long bolts, running through the water ways. The joints are faced, so no nipples or packing are needed. The dotted lines at the back show the rear clean out doors opened, and the deflecting plate thrown back to allow the cleaning of the back fire surfaces.

Fig. 113 shows what is known as a water ring grate, made of hollow cast iron rings bolted together, through which the return water circulates. It is used in connection with wrought iron tubular steam boilers, as in Fig. 114. This same style of ring grate, with some added fire surface at the back, is shown in Figs. 115, 116 and 117 with a large oval magazine feeder for hot water heating.

Figs. 118 and 119 show a similar vertical water grate, made of wrought iron tubes expanded into cast iron top and bottom headers, and connected with a steam boiler. This arrangement gives a large fuel reservoir, and will allow a very high rate of combustion.

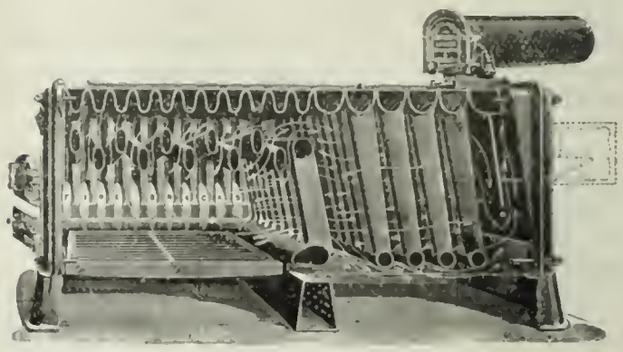

Fig. 112.

Fig. 113.

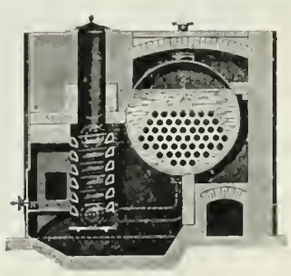

Fig. 114.

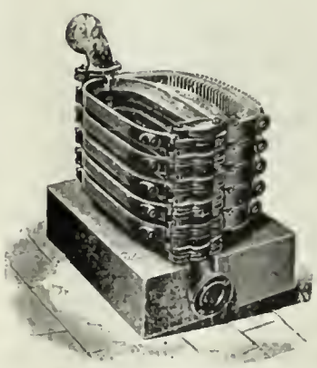

Fig. 115.

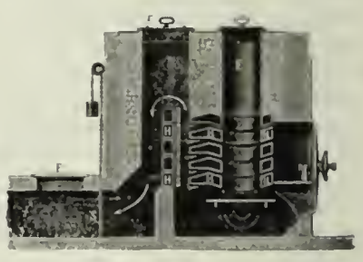

Fig. 116.

Fig. 117.

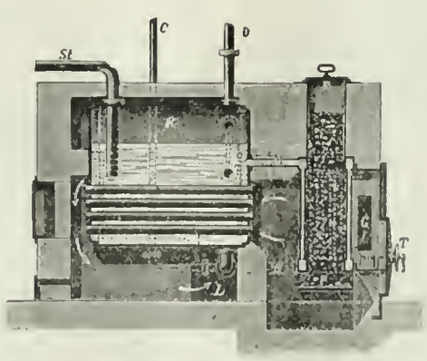

Fig. 118.

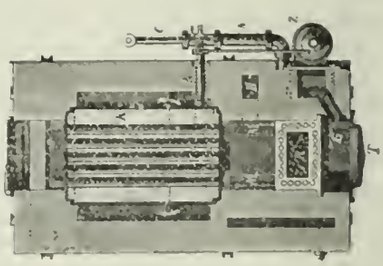

Fig. 119.

EUROPEAN HEATING BOILERS.

The cast iron ring grate, shown in Fig. 113, has five sections with 2.8 square feet of fire surface each, or 14 square feet in all. It is 25 inches high, and will hold about 2 bushels of coke. The one given in Fig. 115 is also 25 inches high, but has 10 square feet of surface per section, or 50 square feet in the complete grate, as shown, which is the smallest size.

Another style of German sectional boiler, with a water grate, and a very large fuel chamber is shown in Figs. 120 and 121. In a test made with a hot water boiler of this type that had 65 square feet of fire surface, 2750 pounds of water per hour was taken from the city water service, entered the boiler at 50 degrees F., and was raised in temperature to 185 degrees F., meaning, in

round numbers, that each square foot of surface took up about 5700 B. T. U. of heat, or 371,000 heat units for the whole boiler, which had a catalogue rating of 260,000 heat units per hour, based on an absorption of 4000 B. T. U. per square foot. The average temperature of the escaping gases in the smoke flue was 225 degrees F., and it was estimated that 10,000 B. T. U. of heat per pound of coke burned, were effective.

For high pressure hot water heating or what is known as the "Perkin's System," the boilers used are made only of heavy wrought iron pipe coils, bent in many different ways, and inclosed in brick walls. Fig. 122 presents a fact that every part of the system must be perfectly balanced. The coils can be divided into as many parts as are wanted, so that each part of the building has its own boiler.

In Fig. 126 is shown a flat wall coil, with the method of connecting, the three way cock, allowing the water to circulate through the coil, or to short circuit into the return as indicated by the arrows. Hence the circulation is never stopped at any time.

The expansion pipes for a closed system are represented in Fig. 127. The pipes *a*, *a*, must be of proper dimensions for the system, both in length and diameter, and must be filled with water up to the level of the top of pipe end *b*, the caps on the ends *b* and *c* being removed during the process of filling the apparatus. For larger systems, several of these expansion pipes must be coupled together.

Fig. 128 shows an expansion tank with a combination

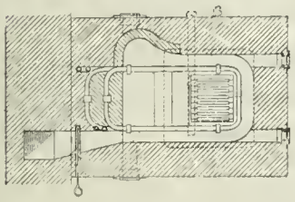

Fig. 125*a*.

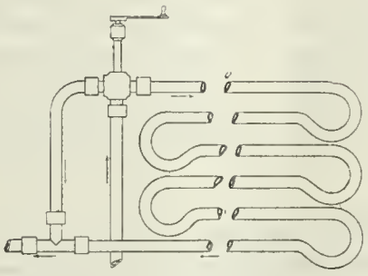

Fig. 126.

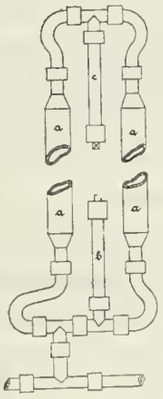

Fig. 127.

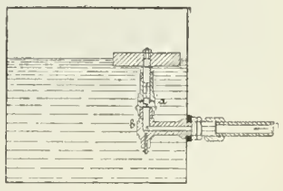

Fig. 128.

EUROPEAN HEATING BOILERS.

boiler of this type with a double coil, and a furnace built in front of it, from which the fire passes over the bridge wall and then down through the coils. The slide damper, *d*, shown just under the grate, when opened, allows air to pass into the air space around the fire pot and enter the combustion chamber on either side of the feed door.

Fig. 123 is a smaller single coil boiler with a magazine feed.

Figs. 124 and 125 are double coil boilers with magazine, in the first of which the coils are together, while in the other they are separate and provide for a longer travel of the gases.

In any of these boilers, the exact amount of fire surface wanted can be exposed to the heat of the flames, an arrangement that is absolutely necessary in view of the safety and vacuum valve for middle pressure hot water heating, which allows the water in the system to escape into the tank when the pressure is excessive, and to return through the vacuum valve as the pressure goes down.

High pressure hot water heating is extensively used in Belgium, but not so much in other European countries.

The writer has not shown any of the boilers herein illustrated and described because he believed in any one of them or considered them models for American engineers, but to convey to the American the European idea of boilers and boiler construction. As each one is the result of the best thought of some ambitious designer, these descriptions will, it is hoped, be at least of interest, if not of service, to the profession in America.

(THE END.)

Keeping Track of Contracts and Jobs.

The system of keeping track of contract work and jobs herewith described is in use by Rossman & Bracken Company, plumbing and steam fitting contractors, 132 East Forty-second street, New York City. Besides the usual day book and ledger, there are used in this system estimating sheets, estimating book, contract record book and contract cost book, all of which are of plain ruled paper, without printed forms. The firm also use printed forms of time sheets, time record book, slips for orders for material on the shop, order slips for material on material houses and charge tickets.

FILL THIS TIME SHEET UP DAILY, AND NOT AT THE END OF THE WEEK.

ROSSMAN & BRACKEN CO., 132 East Forty-second Street, New York.

Time Sheet of James A. Ryan and A. Sunbergen Helper for week ending, Oct 4 1901

Approved by

WRITE DOWN MINUTELY THE DESCRIPTION OF WORK DONE EACH DAY, WHAT FLOOR OF BUILDING, AND WHAT PIECE OF WORK ENGAGED ON

	WHERE	STATE EXPLICITLY ON WHAT FLOOR AND ON WHAT FIXTURE YOU WERE ENGAGED	Contract or Extra Work	When Completed	Workman's Time in Hours	Helper's Time in Hours	Over time Workman	Over time Helper	EXPENSES
SATURDAY	26 St 5 ave	Testing brass lines			4	4½			
MONDAY	"	"			8	8½			
TUESDAY	"	Testing soil lines			8	8½			
WEDNESDAY	"	Connecting soil lines in cellar and running leader out to street			8	8½			
THURSDAY	"	Roughing traps for urinals			8	8½			
FRIDAY	"	"			8	8½			

48 hours constitutes a week's work for workmen, and 51 hours for helpers, which ends Friday night. This slip must reach the shop Friday evening, fully made up, otherwise no wages will be paid.

Keeping Track of Contracts and Jobs.—Fig. 1.—Time Sheet, Actual Size 9 x 12 Inches.

ESTIMATING SHEETS AND BOOK.

When a contract job is to be figured on the work is done on estimating sheets. The estimate includes all material and labor required on the job, figured in detail. The sheets are then filed and if the job is secured the memorandum is copied complete on the estimating book. This book is chiefly useful to refer to if, for instance, the party should claim that all work that was figured on has not been done. If subsequent changes are made in plans or specifications it is learned from this book whether more or less material and labor are required than on the original contract, and whether an addition or reduction is to be made in the original contract price.

CONTRACT RECORD BOOK.

After copying the items of a secured contract on the estimating book the contract price is entered on the contract record book, which is used mainly as a book of record. It is not unusual for large contracts to extend over a period of six months or a year. Sometimes extra orders are received on the same job or deductions are made on the contract. The resulting additions or deductions in price are charged or credited on this book as they may be made.

Time for Week ending Nov 15 1901

NAMES	S	M	T	W	T	F	S	Total Time	Rate p. day	Total Amount	Amount Due	Amount Paid

Broadley	1½		½	½		½		3			6 00		Ok
Hauer	X	X	X	X	X	1½		5½			5 25		

Fig. 2.—Time Roll Book.

CONTRACT COST BOOK.

Information relating to the material and labor put into a job is obtained from the contract cost book. An estimate is made of the probable amount of space that will be required in this book for a contract job, as, for instance, 10 or 15 pages. Should orders be received to discontinue the job at any time, or if the company are desirous of knowing how much money they have put into the job, which may happen at the end of a fiscal year, the desired information is easily arrived at by entering the cost of material and labor put into the job up to date in this book.

TIME SHEETS.

Every Friday morning, when the sheets of the previous six days are turned into the office by the workmen, each one is given a time sheet like the one reproduced in reduced size in Fig. 1. The size of the sheet is about 9 x 12 inches and is of paper made of manila stock. As the workmen are paid on Saturday this arrangement gives the bookkeeper a day in which to make up the pay roll book. It will be seen that on the top of the time sheet explicit instructions are given regarding the filling out of the sheet by each workman, while at the bottom of the sheet the number of hours constituting a week's work is defined. Helpers are expected to be on the job half an hour earlier than the workmen, to have tools ready and the fire lighted, if one is to be used. The workmen report on the job each day, although not at the shop, and they are expected to put in full time. If it is subsequently desired to know what work was being done at any time and who did it the time sheets tell the story.

TIME ROLL BOOK.

After the time of the workmen is transferred on Saturday from the various time sheets to the time roll book, a portion of a page of which is shown, reduced, in Fig. 2, the amounts are footed up, and this amount shows the total cost of labor for the week, which sum is drawn from the bank for paying the workmen.

ORDER SLIPS.

When the foreman on a contract job needs material he fills out an order on the shop, as shown in part in Fig. 3, reduced. The size of this slip is 8½ x 11 inches. It is of orange colored paper.

ROSSMAN & BRACKEN CO.,
132 EAST 42D STREET.

NOTICE.—Goods will be furnished only on a written Order, marked Extra or Contract and Signed.

6	2" drips - closet 4"		
1	2 x ¾ Tee		

Fig. 3.—Order Slip, Actual Size 8½ x 11 Inches.

ORDERS ON MATERIAL HOUSES.

Comparatively little stock is carried in the shop, and the buying of material required on jobs is done day by day by the use of orders on material houses, as shown, reduced, in Fig. 4. These order slips are printed on white paper, 4 x 8 inches in size. They are bound in hook form, two to a page, and perforated, so as to be easily torn out. When an order is made out by the bookkeeper for material as called for by the foreman's order a carbon copy is taken of each order, and when the invoices for the material are received they are checked up with the carbon copy of the order.

CHARGE TICKETS.

For workmen doing jobbing work in the immediate vicinity of the shop a charge ticket is provided, as shown

Charge Ticket.

NEW YORK, Nov 25 1901

CHARGE John H. Smith
479 - Thirdlow

2 # Solder
100 # Lead
2 days Plumber + Helper

Repairing Water main

NAME OF WORKMAN, Thos O'Brien
John Jacobs

Fig. 5.—Charge Ticket, Actual Size 5½ x 8¼ Inches.

In Fig. 5, reduced. These tickets are of white paper, 5½ x 8¼ inches in size. The material used on each job is charged on the ticket by the bookkeeper when it is taken from the shop. The workman puts down the time when the job is finished, signing his name and the name of his helper. The time and job are also entered by the workman on his time sheet. The charge tickets are allowed to accumulate until the end of the month, as a 30-day business is done. During the month there may be two or more charge tickets for the same party.

At the end of the month the different accounts, as represented by the charge tickets, are assembled. Items of the same kind of material in each account are grouped and the number of hours are added, and both are charged in the day book, to be posted in the ledger. This entails less work and is a more simple method than to enter the various items from the charge tickets into the day book each day. The tickets are filed for reference in case of dispute in settling the monthly accounts. By this system the ledger is kept posted to date, while the contract cost book can be kept up by the bookkeeper at his leisure.

THE ATTITUDE OF THE NATIONAL ASSOCIATION OF MASTER PLUMBERS.

In *The Metal Worker* of October 26 we presented the correspondence between the National Association of Master Plumbers and the National Committee of the Confederated Supply Associations which led up to the abrogation of the New York Conference Resolutions by the Executive Committee of the National Association of Master Plumbers, at a meeting at Cleveland, and the adoption at that meeting of what are known as the Cleveland Resolutions. A special meeting of the National Committee of the Confederated Supply Associations, held in Chicago, to consider the action of the Plumbers' Association, resulted in the adoption of the Chicago Resolutions, which were printed in *The Metal Worker* of November 16, together with the letter which was sent with a copy of the Chicago Resolutions, to President E. D. Hornbrook of the National Association of Master Plumbers.

In response to the invitation to use the columns of *The Metal Worker* to express the views of his association President Hornbrook has sent us the following communication:

PRESIDENT'S OFFICE,
KANSAS CITY, MO., December 28, 1901.

To the Editor: On November 18 you called my attention to an article in *The Metal Worker* in which reference was made to a meeting of the National Committee of the Confederated Supply Associations, held in Chicago on November 12, and asked for an expression from me on the subject, which you stated you would be pleased to place before the trade.

Secretary Woodward, in his published letter of November 13, addressed to me, stated that they desired to repudiate all statements and insinuations intended to convey the impression that they were to blame for the severance of the New York Conference Resolutions, and also that the responsibility for the failure to enforce the resolutions in the Clow case rested as fully upon the Executive Committee of the Master Plumbers' Association as upon the dealers. I asked Mr. Woodward to prove his statements or make a retraction, and as he has not seen fit to do either I am obliged to defend the action of the Executive Committee of our association.

A careful perusal of my letter of November 26, addressed to Secretary Woodward, will explain our position.

We have no fault to find with the manufacturers and jobbers as a whole, and our relations with them are, I hope, as friendly as ever; but our relations with the National Committee of the Confederated Supply Associations were severed because that committee did not and would not act on cases referred to them, not even in cases where the National Joint Standing Committee on Conciliation had found the charges of violations true.

For your further information I inclose you a copy of a four-page circular letter to the manufacturers and jobbers dated October 17. In case you publish any of the correspondence I think that my letter of November 26 to Secretary Woodward will cover the points.

E. D. HORNBROOK, President.

THE POSITION OF THE NATIONAL ASSOCIATION.

All of the correspondence alluded to in this letter has been printed in *The Metal Worker*, with the exception of the letter of November 26, which is as follows:

OFFICE OF THE
NATIONAL ASSOCIATION OF MASTER PLUMBERS,
KANSAS CITY, MO., November 26, 1901.

C. W. Woodward, Secretary National Committee of the Confederated Supply Associations, New York City:

Dear Sir: Yours of November 13 received. It is a waste of time to discuss matters with one who ignores facts and points at issue, and I dislike very much to continue the controversy, but am compelled to defend myself against your charge of having misrepresented matters. I would not believe it, if it did not come to me officially, that you would attempt to deny facts that you know I can prove by your own letters. If your committee did not know these facts it was your duty to advise them.

I challenge you to produce any evidence as to the falsity of any statements in my letters to you of September 20 and October 14, 1901, or in any other letters or statements pertaining to the enforcement or repeal of the New York Conference Resolutions. On the contrary, I can prove by original papers that the National Committee of the Confederated Supply Associations have, through their secretary, declined to carry out the New York Conference Resolutions in cases of violations referred to them, where the facts were admitted as violations; and I repeat that such failure on the part of the National Committee was the only reason that the plumbers abrogated the New York Conference Resolutions.

You state that the failure to enforce the New York Conference Resolutions in the Clow case rests as fully upon the Executive Committee of the Master Plumbers' Association as upon you. I emphatically deny that the master plumbers are in any way to blame. W. E. Clow, representing James B. Clow & Sons, distinctly notified your National Committee at the time of the joint meeting in New York City, just before the adoption of the New York Conference Resolutions, that they would not be bound by any joint resolutions that might be adopted unless the resolutions suited them. They have not observed the resolutions that were adopted. Your members preferred charges against them for violations. The Joint Standing Committee on Conciliation, on which three of your most representative members (Messrs. Wolff Nelson and Hooper) served, considered the charges made by the jobbers and the plumbers against James B. Clow & Sons, and unanimously recommended a certain course of action in accordance with the New York Conference Resolutions, and your National Committee did not carry it out, though we waited (when the case had been pending since January, 1901,) from July 25 to September 20, for you to act, or give us some assurance that your National Committee would carry out the decision of the Joint Standing Committee on Conciliation.

There is another complaint of longer standing, where your National Committee did not carry out the New York Conference Resolutions. There is a third complaint pending since February 12, where your member had for months continued to disregard the instructions you stated you gave him to observe the New York Conference Resolutions, and no action was taken by your National Committee after your member had admitted the facts and did not agree to discontinue such sales. There is a fourth complaint, where you declined to carry out the instructions of Chairman Torrance.

Before we repealed the New York Conference Resolutions, seven complaints, with sworn statements to prove some of the cases, were referred to you, and some of them have not even been acknowledged.

Regarding the charge of the master plumbers being hasty: Before severing our relations under the New York Conference Resolutions I urged you to give me by a certain date a positive answer as to what you proposed to do on four pending cases, and I received no satisfaction; and having waited 18 days, after giving you notice that we must be advised positively what your National Committee proposed to do, our National Committee abrogated the New York Conference Resolutions. Under all the circumstances it is ridiculous to charge us with being hasty.

I am a sincere believer in arbitration. I was an earnest advocate of the New York Conference Resolutions, and as a delegate to the Baltimore convention worked for their adoption. For over a year I did all I could to make the New York Conference Resolutions a success. At the Kansas City convention, notwithstanding there was an evident disposition on the part of some of your members to evade and disregard the New York Conference Resolutions, I, with others who believed in the principles of arbitration, urged that the New York Conference Resolutions be reaffirmed and continued provided they were enforced by your National Committee. After your many delays and your refusal to carry out the New York Conference Resolutions and the instructions of Chairman Torrance, which I can prove by letters from yourself and Mr. Torrance, I was forced to the unpleasant conclusion that the New York Conference Resolutions, which might have been a success, were a failure owing to their not being enforced, and no proper steps being taken by your National Committee to attempt to enforce them.

I demand that you prove that the foregoing facts are not true, or retract your statements—namely: 1, That the responsibility for the failure to enforce the New York Conference Resolutions in the Clow case rests as fully upon the Executive Committee of the Master Plumbers' Association as upon your National Committee, and 2, that the cause of the severance of the New York Conference Resolutions was not, as I have stated, owing to the failure of your National Committee to carry them out.

I will wait ten days from the date of this letter for you to make a proper correction in the trade press and to your members of your statements in your published letter of November 13, 1901, and if I do not hear from you that it has been done, or will be done immediately, I will take the matter up and enter a positive denial myself, and call for a committee of loyal manufacturers to investigate the facts.

E. D. Hornbrook, President.

Foreign Trade in Boilers and Radiators.

From various sources of information an estimate has been made that about 1500 steam and hot water heating boilers have been shipped from the United States to Europe during 1901, and that 90 per cent. of the total were shipped by four manufacturing houses. The amount of radiation sent abroad last year based on similar reports is calculated at several million square feet. It is stated that one Canadian concern export annually about 1,000,000 square feet of radiation.

The same authority that presents these statistics points out that Europeans are adepts in copying, and that a phenomenal increase has taken place abroad in the number and size of the factories making the goods referred to. Such plants are now being erected in several of the European countries. This would seem to indicate that the time is not far distant when foreign plants will be able to offer substantial competition in the field of boilers and radiators.

A newspaper report states that two plumbers working in Paterson, N. J., placed a gasoline furnace on a kitchen range which had a fire in it, with the result that the furnace was wrecked and considerable damage done to the interior of the room, while both of the men were burned seriously. It would seem that the care which the conscientious plumber should exercise in doing his work would have prevented such a gross piece of negligence.

The Libra Automatic Air Valve.

The American Radiator Company, Chicago, have just put a new radiator air valve on the market. It has been their experience that one of the greatest needs of the heating business has been a perfect automatic air valve. The Libra automatic air valve is claimed by them to be a perfect article. They say it is constructed upon correct principles, as it operates solely by the use of the elements in a steam system—viz.: air, heat and water. It has been thoroughly demonstrated, they claim, that the valve is truly automatic, and is so extremely sensitive that every particle of air is allowed to escape from the radiator. This automatic air valve is so constructed that it offers no opportunity for inquisitive or malicious persons to tamper with or destroy the adjustment. Once the valve is screwed into position and a slight amount of condensation permitted to gather in the well, it is said

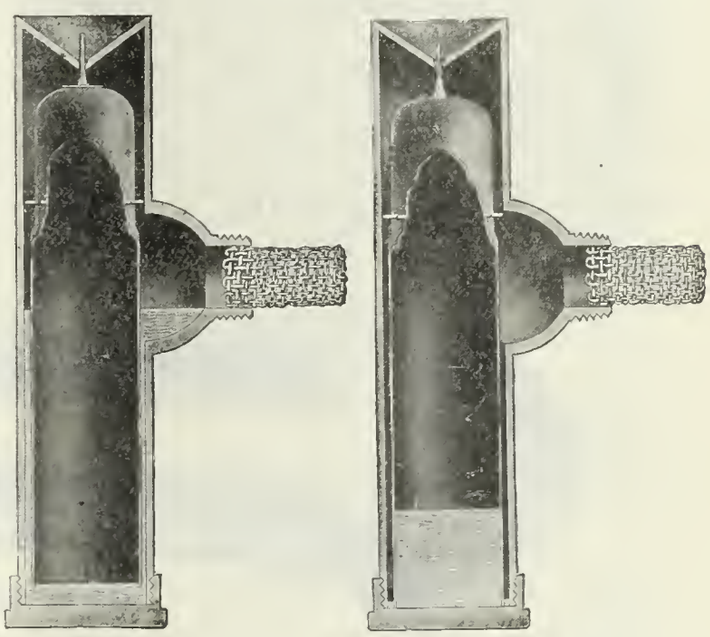

Fig. 1.—Valve Closed. *Fig. 2.—Valve Open.*

The Libra Automatic Air Valve.

to require absolutely no further attention. It is noiseless in operation, and contain nothing which will deteriorate. Its wire screen prevents ingress of grit. The pin or valve seat is of tempered German silver, so that it cannot be cut or injured. It is shapely in form, and hugs the radiator closely. The company further state that it will not cure a bad job of piping or relieve a "water logged" or trapped radiator, but it will do all that is expected of a perfect automatic air valve, and it will wear forever. The valve is shown closed in Fig. 1, and in Fig. 2 it is shown open, the sectional views enabling the operation and construction to be thoroughly understood.

Albany Master Plumbers.

The annual meeting of the Master Plumbers' Association of Albany, N. Y., was held in the De Graaf Building, at Albany, on December 17. After hearing the reports of the officers and attending to the regular business, the following officers were elected for the ensuing year:

President, Frank F. Schimpf.
Vice-President, John J. Britt.
Recording Secretary, Edward Van Loon.
Financial Secretary, Edward D. Scott.
Treasurer, John H. Russell.
Sergeant-at-Arms, T. W. Prior.
Trustees, Herman H. Russ, Richard N. Safford and Allan Gilmour.

D. J. Malene, 88 State street, Binghamton, N. Y., has the contract for the plumbing of the new station for the Delaware, Lackawanna & Western Railroad, at Cortland, N. Y.

New York City Notes.

There is every reason to believe that nearly every plumber in the city is satisfied with the past year's work—that is, if he figured high enough and suffered no losses. The volume of work of all kinds done has been seldom exceeded, and prices in most cases have been good. The builders engaged this year have been of a better financial standing than usual. Hence the losses have not been as great and, in consequence, many are feeling much happier than they did a year ago.

* * *

Contracts still continue to be awarded, and many plumbers will be busy during the winter. Among the late jobs given out are the Pabst Theater and a 12-story apartment hotel at Fifty-eighth street and Eighth avenue. T. Sullivan of 117 East Twenty-third street put in the sewers here, and E. J. McCabe & Co. of 862 Park avenue have just captured the contract for the balance of the work. J. B. Barry of 180 Lenox avenue has just begun work on a large apartment house at Sixth avenue and Fifty-eighth street; James Armstrong of 52 Dey street has the East Side Home on Exterior street, foot of East Seventy-sixth street; Frank Hertel of 1515 Third avenue has a large factory building at Ninety-third street and First avenue; Rossman & Bracken have the plumbing contract for the palatial residence of Senator Clark of Montana at Fifth avenue and Seventy-seventh street; A. W. Reynolds has a large apartment house on Ninety-fourth street, west of Amsterdam avenue, and J. J. Smith is doing the plumbing in the new power houses of the Manhattan Elevated Railroad, at Fifty-third street and Eighth avenue and Spring street, near West Broadway.

* * *

T. J. Andrews, Chief Inspector of Plumbing in the Building Department, has been appointed under the new administration, and the appointment is popular with the association.

* * *

John A. Lee, who was Chief Examiner of Plans under the Chief Inspector of Plumbing in the Building Department, has been appointed Chief Examiner of Plumbing Plans in the new Tenement House Department, under the Building Department. Edwin Carroll, his old associate, has been appointed as his assistant.

* * *

Matthew Haley, B. J. Gorman and James Farrell are among the 16 inspectors of plumbing under the old administration who have been laid off by the new administration.

* * *

James G. Collins of 211 East 116th street, New York, has been appointed Superintendent of Highways of New York by Borough President Cantor. Mr. Collins was formerly one of the "standbys" of the Master Plumbers' Association, and is still a member, although not an active one. He is said by the trade to be well qualified for his work and his appointment is popular.

* * *

Horace Loomis has been appointed Superintendent of Sewers of the Borough of Manhattan, New York. Mr. Loomis has been an *ex officio* member of the Examining Board of Plumbers of New York City from its inception.

Death of Daniel Newman.

Daniel Newman died on Tuesday, December 24, at his home on West Coit street, New London, Conn. He was a native of Ireland, and came to New London in 1850, where he learned the plumbing trade in the shop of Smith & Grace. In 1870 he entered into business for himself in company with J. D. Cronin, under the firm name of Newman & Cronin. Mr. Newman continued in the business until a few months ago, when ill health forced him to retire, and he was succeeded by his eldest son, Daniel T. Newman. He was actively connected with a number of secret societies, in which his interest was exerted for their good. His death was due to cancer, after having twice undergone operations for its removal. He is survived by his wife, four sons and three daughters.

Eagle Pipe Wrench No. 1.

Frank Mossberg Company, Attleboro, Mass., are offering the pipe wrench shown herewith. It is referred to as being made from best quality of steel forgings, hardened, and taking any size of pipe or nut from ⅛ to ¾ inch in diameter. The wrench is 6 inches long, and weighs 8 ounces. It is alluded to as primarily a pipe wrench, but adapted to a multiplicity of needs, including automobile construction and repair. The wrench is described as requiring no adjustment, being always ready for use on any sized object within the limits of its range; as being instantaneous in grip and letting go when desired, and as simple, effective and convenient.

Eagle Pipe Wrench No. 1.

Heating and Plumbing Notes.

James Ross Stewart, a plumber of Braddock, Pa., died on December 20, from pneumonia, at his residence, 501 Washington street, Braddock.

The Master Plumbers' Association of Brooklyn, N. Y., are engaged in an effort to stop the circulation of the advertising matter on Plumbing Goods having the net prices of the articles as a feature. It is claimed that such circulars find their way into the hands of those who have no right to the privilege and the information contained. The circulation of these net price-lists, it is said, has made trouble for the national bodies of both the plumbers and the supply houses.

New plumbing ordinances have been adopted by the City Councils of Atlanta, Ga., and Jacksonville, Fla.

The Canfield Supply Company, Kingston, N. Y., have the contract for placing artistic Steel Ceilings and a hot water heating system, and doing the plumbing and gas fitting in the new store building of Van Duzen Brothers of that town.

O. F. Doyle, St. Cloud, Minn., bid $1200 and secured the contract for heating the new Court House in that place.

Bids will be received at the Department of the Interior, Office of Indian Affairs, Washington, D. C., until January 24, for a steam heating and lighting plant for the Indian school at Fort Totten, N. D.

The establishments of Robert Morrison, dealer in Plumbing Supplies, and Ross & Ayer, Pump dealers, of Peoria, Ill., were visited by a fire on December 14, involving respective losses of $10,000 and $5000.

A FIRE in a one-story brick building at 288 Flatbush avenue, Brooklyn, N. Y., occupied by James Hasley as a plumbing shop, caused a damage of about $500 to the stock and fixtures.

IN a recent issue we mentioned that the resignation of Charles S. Hirschfeld as manager of the Plumbers' Brass Goods department of Landers, Frary & Clark, at 62 Chambers street, New York, had been tendered to take effect on January 1. Mr. Hirschfeld now advises us that he will not, after all, sever his connection with the company, but will continue to act as manager of their Plumbers' Brass Goods department. He adds that it has been decided by the officers of the concern to greatly increase the production of the present lines of Brass Goods and to add a line of new goods as soon as possible. Mr. Hirschfeld will continue the policy that he originally outlined, by marketing these goods through large jobbers all over the country. A new catalogue of Plumbers' Goods is being gotten out by Landers, Frary & Clark, and will be ready for distribution next week.

IT is reported from Pittsburgh that a pool to control the Sewer Pipe trade east of the Mississippi River has been formed by the American Sewer Pipe Company, in which all of the 22 independent manufacturers of Sewer Pipe are included. Arrangements are now being made to establish agencies in New England, New York, Pennsylvania, Ohio and certain districts of the West. A uniform scale of prices will, it is understood, be adopted. The first meeting for the selection of the agencies and to definitely decide upon prices will be held early in the present month. It is said that efforts are now being made to extend the pool to include all the territory west of the Mississippi also.

STANLEY G. FLAGG & Co. of Philadelphia, have purchased 10 acres of ground adjoining their foundry plant at Pottstown, Pa., with the view of enlarging their facilities there.

H. L. ANNESS, who for a number of years has been connected with the International Heater Company, has resigned his position, having gone into partnership with T. B. Cryer of Newark, N. J., to continue the business of T. B. Cryer & Co., heating contractors, in that city.

THE ALGOMA TUBE WORKS, LIMITED, of Canada, just incorporated with an authorized capital of $30,000,000, is the largest company ever organized in Canada. It is one of the F. H. Clergue enterprises. The new company will manufacture Metallic Tubes on the Perrin patent, and their plant will be located at Sault Ste. Marie.

HALF-TONE engravings in the current number of the *Interstate Architect and Builder* show the steel frame and truss work of the new machine shop erected at Detroit by the American Radiator Company of Chicago. A feature of the work was the rapidity with which this building was erected to replace that destroyed by fire on April 5. On April 10 the first contract was awarded for a 123 x 300 foot building and 21 days later, on May 1, the structure was ready for the roof. The erection of the main warehouse, 150 x 444 feet, was carried on simultaneously, and with the new cleaning room and fire proof pattern house the equipment was soon accomplished, giving the company a plant for the manufacture of Radiators of extensive capacity, greatly in excess of their former plant. This speedy erection of so large a plant is truly one of the achievements of the year.

PLUMBING INSPECTOR COOK of South Omaha, Neb., asserts that a great deal of light weight lead piping is being used by plumbers. In some instances pipes that have been dug up are found to have burst on account of being too thin.

E. J. DUNPHY & Co, of Dedham, Mass., have secured the contract for heating the officers' quarters at Fort Banks, Winthrop, Mass., and will use Winchester Heaters.

THE HILDRETH MOTOR & PUMP COMPANY, Lansing, Mich., are purchasing the equipment for the new three-story brick building, 20 x 54 feet, they are to erect. This includes an 18 inch by 8 foot lathe, 20-inch shaper, 20-inch drill press, modern tools and a new or second-hand power elevator. The new company are a reorganization of Hildreth & Co., manufacturers of Iron Pumps and Supplies, and will continue the manufacture of the same line as heretofore, to which will be added the manufacture of Gas and Gasoline Motors from 1 to 12 horsepower.

THE A. VOGLER SHEET METAL MFG. COMPANY, St. Louis, Mo., have incorporated with a capital stock of $15,000 and have opened a factory at 24 South Main street, for the manufacture of Oil and Gasoline Tanks, Bathtubs and all kinds of Cans and Containers. The officers are A. Vogler, president and manager, formerly of the firm of Vogler & Blanke, and H. Goldsmith, secretary and treasurer.

THE WHITLOCK COIL PIPE COMPANY of Hartford, Conn., describe their American Separators and Exhaust Heads in a recent pamphlet.

"AN IMPORTANT ANNOUNCEMENT," is the title of a four-page circular issued by the American Radiator Company of Chicago, asking the criticism and assistance of steam fitters on the plans they have adopted in bringing steam and hot water heating more prominently to the attention of the general public. The circular incloses four advertisements illustrated with half-tone engravings, calculated to attract the eye and with the text so worked as to impress all who read it with the merits of steam and hot water heating. The announcement states that these advertisements appear in 20,000,000 copies every month of the leading family magazines. Those who wish to assist in and profit by the company's campaign of education of the general public, are invited to secure copies of their publications entitled "Home Successful" and "New Business Bringer."

C. C. WILSON of the Charles Graham Chemical Pottery Works, 986 to 1018 Metropolitan avenue, Brooklyn, N. Y., was a visitor at *The Metal Worker* office this week. Mr. Wilson reports an active demand for the high grade Sanitary Earthen Ware, Sinks, Laundry Tubs and Pantry Sinks made by the concern.

THE PRIZER-PAINTER STOVE & HEATER COMPANY of Reading, Pa., are sending to the trade a 32 x 36 inch hanger, bound with metal edges showing their Henderson Steam and Hot Water Heaters. These Heaters are said to be of the "Never Break kind." The vertical sectional Heaters are of the return flue type of push nipple construction. One peculiar feature is an air blast, which brings into contact with the gases rising from the fire, jets of highly heated air which causes the ignition of the gases and the generation of intense heat, increasing the economy and efficiency of the Heater. The Henderson Orbis Heaters are of round form, presenting a large amount of fire surface, and a long fire travel. The construction and operation of these various Heaters may be readily seen by means of broken views and views of partially completed heaters which are presented. The hanger also gives the addresses of the various branch houses of the concern, and it is provided with suitable loops for hanging up in the heating contractor's shop, where it will be valuable for reference.

J. W. CUFF & Co., Philadelphia, Pa., have the contract to install a $8063 heating and ventilating apparatus in the Boys' High School, at Fifteenth and Green streets, in that city. They will also install a steam heating system in the Baptist Church on West Girard avenue.

JAMES T. MURRAY, Hartford, Conn., has the contract for heating the new Tuberculosis Hospital on Cedar Mountain.

THE PROGRESS FURNACE & STOVE COMPANY of Springfield, Ohio, are installing a power and heating plant in the factory of the Krell-French Piano Company, in that city.

WILLIAM J. HIGHLAND, plumber, of 104 Dwight street, Springfield, Mass., is presenting his customers with a neat and attractive calendar.

THE Board of Supervisors of Duchess County, New York, have awarded the contract for plumbing and heating the new Court House, at Poughkeepsie, N. Y., to William Moore at his bid of $21,146. They also awarded the contract for plumbing and heating the County House to Bannon & Co. of Rondout, at their bid of $9492.

THE FRANK J. KNOX COMPANY, Hartford, Conn., deal-

UNIVERSITY OF ILLINOIS LIBRARY

ers in Plumbers' Supplies, are distributing among the trade a handsome calendar.

WILLIAM E. DONOHUE is moving his plumbing stock and material to his home, at 219 Bloomfield street, Sp[illegible] Mass., where he is erecting a new plumbing shop [illegible]. The store has passed through three fires at his old stand, and hopes to escape other fires in his new location.

OWING to constantly increasing business the Canfield Supply Company, Kingston, N. Y., jobbers of Plumbers' and Tinners' Supplies, have found it necessary to increase their force of salesmen and have secured the services of Leroy Magee as local salesman. Norman MacDonald will represent the concern in their Eastern New York and New England territory.

THE PIERCE STEAM HEATING COMPANY of Buffalo, N. Y., have filed with the County Clerk a report concerning the election of three new directors. These officials are John B. Pierce, Joseph Bond and Elmer Dickinson.

HUEY BROS. of Boston, Mass., are installing four Winchester Heaters in the barracks and officers' quarters at Fort Revere, located at Hull, Mass.

New Firms and Changes.

THE SCHAFFER & BUDENBERG MFG. COMPANY have been incorporated in Brooklyn, N. Y., with a capital of $100,000 to manufacture Steam Fitters' and Plumbers' Supplies.

THE plumbing firm of Bateman & Burt, at Winchendon, Mass., have been dissolved, and the business will be continued by Harry Bateman.

THE EASTMAN MFG. COMPANY of Bridgeport, Conn., have been incorporated with a capital stock of $90,000 to make Plumbing Supplies and Heating Apparatus.

L. A. HOFFMAN & SON have succeeded L. A. Hoffman in the plumbing, heating and tinsmithing business at 254-256 North Broad street, Elizabeth, N. J.

DANA O. MILLER of Chester, Vt., has taken his brother, William, into partnership with him in his plumbing and tinning business.

FREDERICK WEBSTER has opened a gas fitting and plumbing establishment in the Opera House Block, at Beaver, Pa.

TRADE NOTES.

THE OHIO BRASS COMPANY of Mansfield, Ohio, have increased their capital stock to $50,000. E. T. Cooke is president of the company and C. K. King secretary.

THE SCRANTON CORUNDUM & EMERY WHEEL COMPANY of Scranton, Pa., report an increased sale of their products, taxing the new facilities added to their plant during the year. The increased demand is from both domestic and foreign sources. The company's Black Diamond Abrazer has been found especially adapted to the requirements of the Stove manufacturing trade.

THE METALLIC MFG., PLATING & ENAMELING COMPANY of Chicago, Ill., have been incorporated with a capital of $2500. George N. Lyman, Harry B. Signor and George D. Bardon are the incorporators.

THE CHICAGO BRASS COMPANY, Kenosha, Wis., manufacturers of Brass and Copper Sheets, Tubing, Rods, &c., will discontinue their Chicago house, removing that branch to Kenosha.

THE RANDOLPH-CLOWES COMPANY, Waterbury, Conn., manufacturers of Brass and Copper Tubes, &c., advise us that the report that they would move their plant to Buffalo, N. Y., is incorrect.

THE ARCHER IRON WORKS, Chicago, Ill., are sending out a catalogue which will be interesting to Stove dealers and those who operate foundries and machine shops. It contains illustrations of Steel Hand Barrows, Coal and Coke Wagons and various styles of Merchandise Trucks.

U. T. HUNGERFORD BRASS & COPPER COMPANY, 121 Worth street, New York, are notifying their customers by mail that owing to the unsettled condition of the Copper market it is hoped that purchases, until new prices are established, will not exceed actual requirements. They also suggest drawing on their stock in New York for current necessities, thus obviating future loss should a decline occur. By the same opportunity they state their stock of Brass, Copper, &c., in New York warehouse is in excess of 1,000,000 pounds, the leading items of which are mentioned by them.

Ventilate Newly Built Houses.

In discussing the question of sanitary houses a writer in a recent issue of the Journal of the American Medical Association presents some very interesting suggestions:

"Regarding the newly built houses, sanitarians, for the most part, teach that a period of four months in summer and six in winter ought to be allowed between the end of the building operations and the entrance of the inhabitants into a house. In this way will be avoided the accidents that arise from the premature occupation of an apartment.

"It is scarcely necessary to add that, as soon as the house has begun to be occupied, to avoid dampness it should be heated and ventilated; treated, in a word, by all the usual means to maintain a healthy condition of the apartment. If the dampness persists in spite of all these precautions, the proprietor is responsible for the defects in his building.

"Physicians are sometimes requested to estimate the relative dampness of an apartment or room. This is not always easy by simple inspection, as a room may be damp although saltpetre does not grow on its walls or mold in its corners. The following is an exact means of appreciation, and one that is within every one's scope: In the room in question a kilogramme of fresh lime should be placed after hermetically closing doors and windows. In 24 hours it should be weighed, and if the lime has absorbed more than 10 grains of water (that is, more than 1 per cent.), the room should be considered damp and classed as unhealthy.

"The question of dampness of dwellings is a frequent cause of dispute between landlord and tenant, naturally solved in the affirmative by the latter and in the negative by the former. The question can be settled in the future by the test of the hydration of lime, and which will give irrefutable proof or refutation of the validity of such complaint. The dampness of dwellings is a cause of illness. The death rate is greater in quarters where the apartments are damp than where they are dry.

"Ventilation is defective where the walls are impregnated with water; the porosity of the walls is done away with, and can only be re-established after the evaporation of the water has been completed and the heat required to effect this evaporation is furnished by the person living in the room. This is the cause of the vivid impression of cold which we experience in damp places, and it is a well-known fact that exposure to the action of the cold renders the organism more accessible to the attack of morbid germs. The rotting of walls, which appears particularly in places where the water used in building contained nitrates and chlorides, is caused by changes from dryness to dampness and *vice versa*. It gives rise to fragmentation of the mortar, and even of the building stones themselves. Finally frost can split a wall that is soaked in moisture.

"The dampness of dwellings is due to internal or external causes. There can be no doubt that a new building ought to be treated for a length of time by ventilation and heat, with a view to evaporate the really enormous amount of water incorporated with the building materials. According to Pettenkofer, a three-story house requiring 167,000 bricks would need some 825,000 litres of water to build. When this evaporation has been effected great care should be taken in insuring proper drainage for rain and other water."

Secretary Deane of the California Petroleum Miners' Association has published a list of 126 large firms and companies in San Francisco that have adopted oil fuel in place of coal during the past two years. The list contains the names of many of the largest industrial enterprises of San Francisco, including practically all the street railways and great manufacturing plants.

Pattern for Compound Twisted Elbow.

A New York correspondent desires to learn through the columns of *The Metal Worker* how to obtain the patterns for a compound twisted elbow, as shown in Fig. 1. It is very important, our correspondent states, that the elbow have the same dimensions throughout its entire form and that the side curves run perfectly parallel to each other, so that when viewed from either side the curves will be graceful and parallel with each other. Referring to Fig. 1, which is a reproduction of our correspondent's sketch, let A B C D in plan represent the top of the elbow and A^1 B^1 C^1 D^1 the bottom, the elbow making a quarter turn in plan, which reverses the sections of the pipe. D^2 C^2 C^3 B^3 shows the elevation, giving a general view of the twist.

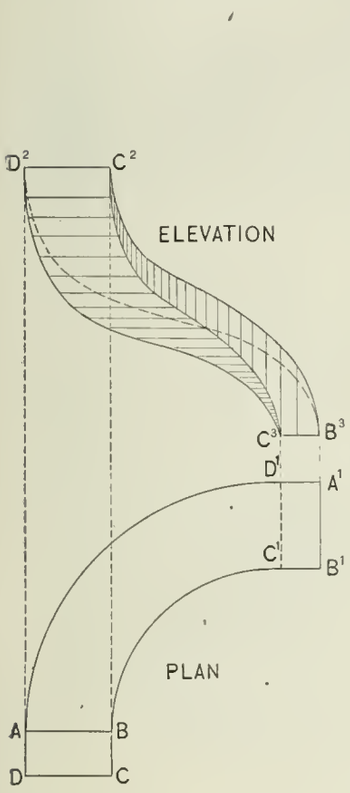

Fig. 1.—Plan and Elevation Submitted by Our Correspondent.

As our correspondent desires that the side curves of the elbow must run perfectly parallel to each other, it will be impossible to first draw the elevation, as the development of the sides must first be obtained and the elevation projected from it. Therefore, in Fig. 2, let A B C D be the plan of the top of the elbow and A^1 B^1 C^1 D^1 the plan of the bottom. Let J represent the center, from which the arcs A D^1 and B C^1 are struck, showing the quarter turn which the elbow is to make in plan.

Before constructing the elevation it will be necessary to lay out the patterns for the inner and outer curve, as follows: Divide the outer curve A D^1 into equal spaces, as shown by the small figures 1 to 4. In similar manner divide the inner curve B C^1 into similar parts, as shown by the figures 1′ to 4′. Draw, as in Fig. 3, any horizontal line, as E F, upon which place the stretchout of the outer curve in plan in Fig. 2, D A 1 2 3 4 D^1 A^1, as shown by D A 1 2 3 4 D^1 A^1 on the line E F of Fig. 3, at right angles to which and from the small figures erect vertical lines, as shown. Assuming that the hight of the elbow is to be as much as indicated by E G, draw the line G H parallel to E F, as shown. As D A and D^1 A^1 on the line E F represent the narrow sides of the section of the elbow, extend the points D and A until they intersect the line G H at D^2 and A^3. From D^2 draw at pleasure a graceful free hand curve to D^1, as shown by D^2 2″ D^1, intersecting the vertical lines previously drawn, as shown by A^2, 1″, 2″, 3″ and 4″. Now set the dividers equal to D^2 A^3 or D^1 A^1 and draw a curve parallel to D^2 2″ D^1, as shown by A^3 3‴ A^1, intersecting the vertical lines at 1‴, 2‴, 3‴, 4‴ and D^3; then will D^2 A^3 3‴ A^1 D^1 2″ D^2 be the pattern for the outside curve of elbow, the lines of which run parallel to each other on the line D A^1 in plan of Fig. 2. As the curves between the points A^3 1‴, D^3 A^1, D^1 4″ and A^2 D^2 of Fig. 3 become rather wide establish an extra point between each, as shown by *a‴*, *e‴*, *b″* and *c″*, respectively. From these points drop vertical lines onto the line E F, as follows: From *c″* drop a line, obtaining the point *c* on

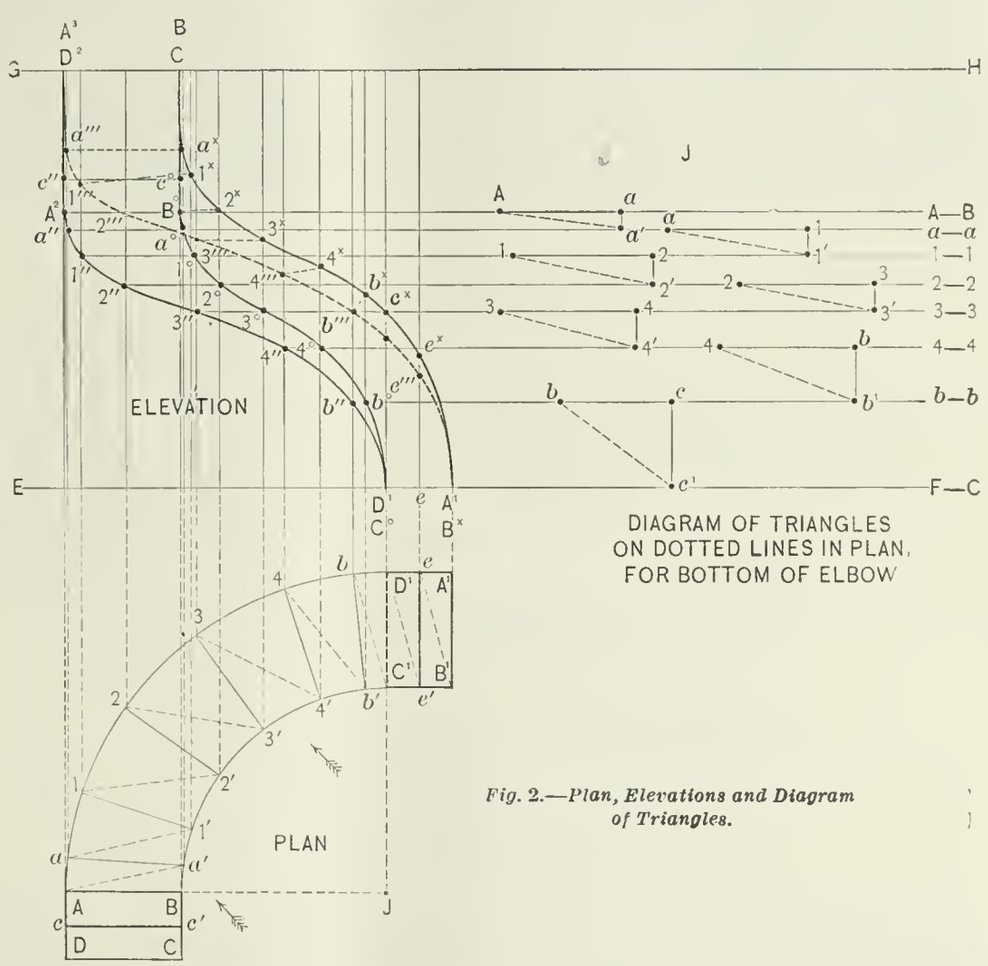

Fig. 2.—Plan, Elevations and Diagram of Triangles.

PATTERN FOR COMPOUND TWISTED ELBOW.

E F. Now take the distance from D to *c* and place it from D to *c* in plan in Fig. 2, and from *c* draw a line parallel to D C, as shown by *c c′*. In the same manner, from *a‴* in Fig. 3 drop a line, intersecting the lower curve at *a″* and the line E F at *a*. Take the distance from A to *a* and place it as shown from A to *a* in plan, Fig. 2. In the same manner in Fig. 3, from point *b″*, draw a vertical line, extending it upward until it intersects the upper curve at *b‴* and the line E F at *b*. From the point *e‴* drop a line, intersecting E F at *e*. Now take the distance from A^1 to *e* and place it in plan, Fig. 2, as shown, from A^1 to *e*. From *e* draw a line parallel to A^1 B^1, as shown by *e e′*. Finally, take the distance from 4 to *b* of Fig. 3 and place it in plan in Fig. 2, as shown, from 4 to *b*.

In Fig. 2 draw any horizontal line, as E F, and take the distance from E to G in Fig. 3 and place it from E to G in Fig. 2. From G draw a line parallel to E F, as shown by G H. At right angles to E F and from all the points on the outer curve D A^1 in plan erect vertical lines, as shown. Measuring in each instance from the line E F of Fig. 3, take the various hights to the points D^2, *c″*, A^2, *a″*, 1″, 2″, 3″, 4″ and *b″* on the lower curve and place them in Fig. 2, measuring in every in-

stance from the line E F on lines drawn from similar numbered points in plan, thus locating in elevation the points D^2, c'', A^2, a'', 1″, 2″, 3″, 4″, b'' and D^1. A line traced through the points thus obtained will represent the miter line in elevation for the bottom line of the outside curve.

To obtain in elevation the top line of the outer curve, take the various distances in Fig. 3 to points A^3, a''', 1‴, 2‴, 3‴, 4‴, b''', D^3, c''' and A^1, measuring in each instance from the line E F, and place them in elevation in Fig. 2, measuring in every instance from the line E F onto lines having similar numbers drawn from the outer curve in plan, thus establishing the points or intersections A^3, a''', 1‴, 2‴, 3‴, 4‴, b''', D^3, c''', A^1, as shown by the dotted line. This would complete the true elevation of the outer curve in plan to correspond to the plan and the development of the outer curve in Fig. 3.

Before obtaining the elevation of the inner curve it will first be necessary to obtain the pattern for the inner curve, for which proceed as follows: Take the stretchout of the inner curve in plan, Fig. 2, as shown by the points C, c', B, 1′, 2′, 3′, 4′, C^1, c', B^1, and place them on the line G H of Fig. 3, as shown by the points C, c', B, 1′, 2′, 3′, 4′, C^1, c' and B^1. At right angles to G H and from these points drop vertical lines, which intersect $a°$, 1°, 2°, 3°, 4°, $b°$, C°. A line traced through the points thus obtained will represent the miter line for the bottom line of the inside curve.

In similar manner, measuring from the line G H in Fig. 3, take the various distances to points B, a^x, 1^x, 2^x, 3^x, 4^x, b^x, C^x, c^x and B^x and place them in elevation, Fig. 2, measuring from the line G H on vertical lines of similar numbers, thus obtaining the intersections B, a^x, 1^x, 2^x, 3^x, 4^x, b^x, C^x, c^x, B^x. A line traced through these points will represent the miter line for the top line of the inside curve of the elbow, and D^2 D^1 A^1 C will represent the elevation of the elbow, shown in plan by D A^1 B^1 C, whose side developments are equal to those shown in Fig. 3.

Referring to the patterns in Fig. 3, it will be noticed that the point A^2 in the pattern for outside curve intersects with the vertical line B in the pattern for inside curve, because the corners in the section in plan, Fig. 2, are lettered A and B. This is mentioned so as not to confuse the reader. As the patterns for the top and bottom will be developed by triangulation, for which diagrams of triangles must be constructed, therefore draw the base lines in plan by connecting similar points, as shown by *a a′*, 1 1′, 2 2′, 3 3′, 4 4′, *b b′* and *c c′*, for solid line triangles, and A *a′*, *a* 1′, 1 2′, 2 3′, 3 4′, 4 *b′*,

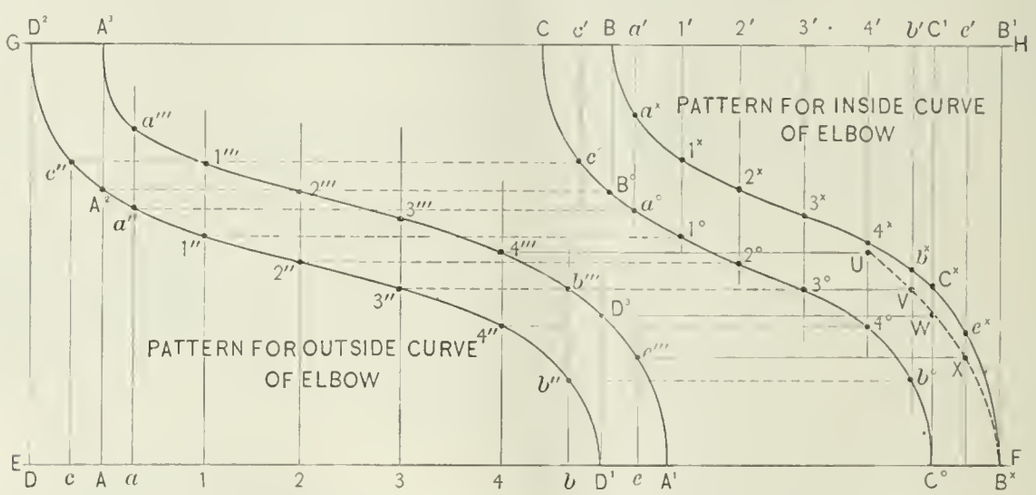

Fig. 3.—Method of Obtaining Patterns for Sides of Elbow.

PATTERN FOR COMPOUND TWISTED ELBOW.

with others drawn parallel to G H from similar numbered points on the lower curve D^2 D^1, thus obtaining the intersections $c°$, B°, 1°, 2°, 3°, 4°, C°. A line traced through these points, as shown, will be the lower cut for the pattern for the inner curve.

As that portion of the elbow shown in plan in Fig. 2 by D A and C B is perfectly straight and has no twist from D^2 to A^2 and from C to B° in elevation, the curve shown in Fig. 3 by C $c°$ B° will be a tracing of D^2 c'' A^2. Now set the dividers equal to C B or C° B^x and draw a curve parallel to C 2° C°, as shown by B 3^x B^x, intersecting similar numbered vertical lines at 1^x, 2^x, 3^x, 4^x, C^x, c^x and B^x. Then will C 2° C° B^x 3^x B be the pattern for the inside curve of the elbow.

As the curves between B and 1^x and 4° and C° are rather wide, introduce extra points, as a^x and $b°$, drawing vertical lines from these points until they intersect the lower and upper curves at $a°$ and b^x and the line G H at *a′* and *b′*, respectively.

Take the distances from B to *a′* and from 4′ to *b′* and place them in plan in Fig. 2 from B to *a′* and from 4′ to *b*, respectively, as shown. Now from all the points contained in the inner curve in the plan erect vertical lines, as shown, into the elevation until they intersect the top line of the elbow G H. Measuring in every instance from the line G H of Fig. 3, take the various hights to points $c°$, B°, $a°$, 1°, 2°, 3°, 4°, $b°$ and C° and place them in elevation, Fig. 2, measuring in each instance from the line G H, on lines drawn from similar numbered points in plan, thus locating the points C, $c°$, B°, *b* C^1, D^1 *e′* and *e* B^1 for dotted line triangles. Thus the sections shown in elevation represent sections on similar numbered lines in plan. For example, 1″ 1° 1^x 1‴ is a section on 1 1′ in plan, as is 4″ 4° 4^x 4‴ a section on 4 4′ in plan, &c. It will be noticed that the bottom lines of the sections in elevation all run in a horizontal plane, while the top are slightly raised on the upper line of the inner curve B 4x B^x. This occurs because the line B 3^x B^x in Fig. 3 is drawn parallel to the curve C 2° C°. If it was desired that the top of the elbow in elevation, Fig. 2, was to show horizontal planes the same as the bottom then in Fig. 3 horizontal lines would have to be carried from points *a‴*, 1‴, 2‴, 3‴, 4‴, &c., on the curve A^3 3‴ A^1 and intersected with the vertical lines *a′*, 1′, 2′, 3′, 4′. &c., in the same manner as the points C″, A^2, *a″*, 1″, 2″, 3″, &c., were intersected with the vertical lines *c′*, B, *a′*, 1′, 2′, 3′, &c., in the pattern for inside curve, and would result in an unequal line, as shown partly by the dotted line *u v w x* B^x in the pattern for the inner curve, which our correspondent wishes to avoid. It is better to have a slight incline toward the top of the elbow, which cannot be seen, than to have an unequal line such as the dotted one *u v w x* B^x would show when viewed from the arrow lines in plan, Fig. 2.

As the solid lines in elevation of bottom of elbow have horizontal planes, then no diagram of triangles will be required on solid lines in plan, the lines there shown in plan being the actual distances. However, diagrams on dotted lines in plan must be obtained, as follows: From the various points in elevation on the

two miter lines representing the bottom of the elbow draw lines to the right of the elevation, as shown by lines A B, *a a*, 1 1, 2 2, 3 3, 4 4, *b b* and F C, which represent the hights in elevation of similar points in plan for the bottom. Now take the lengths of the dotted lines in plan and place them on lines having similar numbers in the diagram of triangles, as follows: For example, take the distance of A *a'* in plan, place it on the line A B in J, as shown by A *a*. At right angles to A *a* draw the line *a a'*, intersecting the line *a a* at *a'*; draw a line from *a'* to A, which is the true distance on A *a'* in plan. In similar manner take the distance of 2 3' in plan and place it on 2 2 in J, as shown by 2 3, at right angles to which and from the point 3 draw the line 3 3', intersecting the line 3 3 at 3'. Then a line drawn from 3' to 2 will be the actual distance on 3' 2 in plan. Proceed in this manner until all of the triangles have been obtained.

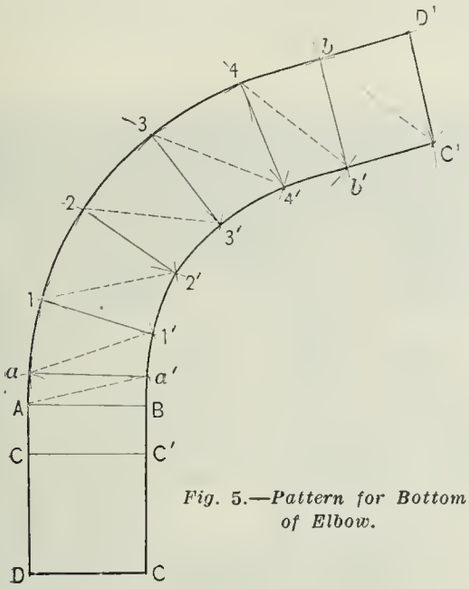

Fig. 5.—Pattern for Bottom of Elbow.

As the top of the elbow shown in elevation does not run on a horizontal plane, diagrams of triangles on dotted and solid lines must be obtained. To avoid a confusion of lines take a tracing of A^3, 3''', A^1, B^x, 3^x, B, which represent the miter lines for the top of the elbow in elevation, and place it with the various points of intersections on same, as shown by similar numbered points in elevation, Fig. 4. From these points draw horizontal lines to the right, as shown by the lines having similar numbers, as A^3 B, a^x *a'''*, 1^x 1''', 2^x 2''', 3^x 3''', 4^x 4''', b^x *b'''*, C^x D^3, e^x *e'''* and A^1 B^x. As the lengths of all the solid lines in plan, Fig. 2, are equal, take the length of A B and place it as shown by A B on the line A^3 B in L of Fig. 4. From the points A and B drop vertical lines, intersecting all the horizontal lines to A^1 B^1 on the line A^1 B^x. Now from the points of intersections on the horizontal lines draw lines connecting lines having similar figures or letters, as *a a'*, 1 1', 2 2', 3 3', 4 4', *b b'*, D^1 C^1 and *e e'*, which represent the actual distances on solid lines having similar letters or figures in plan in Fig. 2.

For the triangles on dotted lines in plan proceed in the same manner as shown in J in elevation. For example, take the distance of 3 4' in plan and place it on the line 3^x 3''', as shown by 3 4, in N in Fig. 4. From 4, at right angles to 3 4, draw the line 4 4', intersecting the line 4^x at 4'. Draw a line from 4' to 3, which represents the true length on the line 4' 3 in plan, Fig. 2. Proceed in similar manner for the balance of the triangles on dotted lines shown in N of Fig. 4.

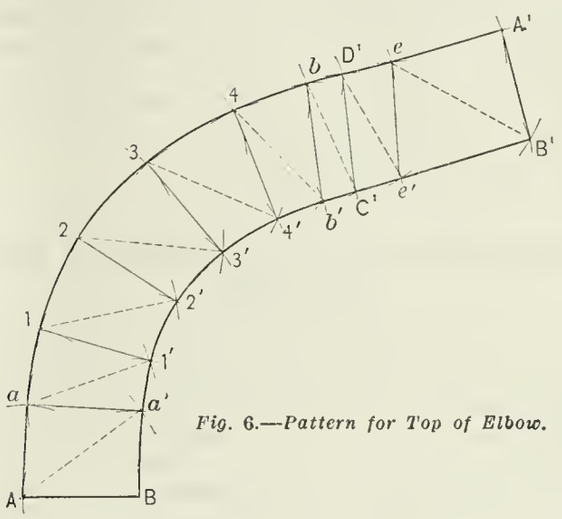

Fig. 6.—Pattern for Top of Elbow.

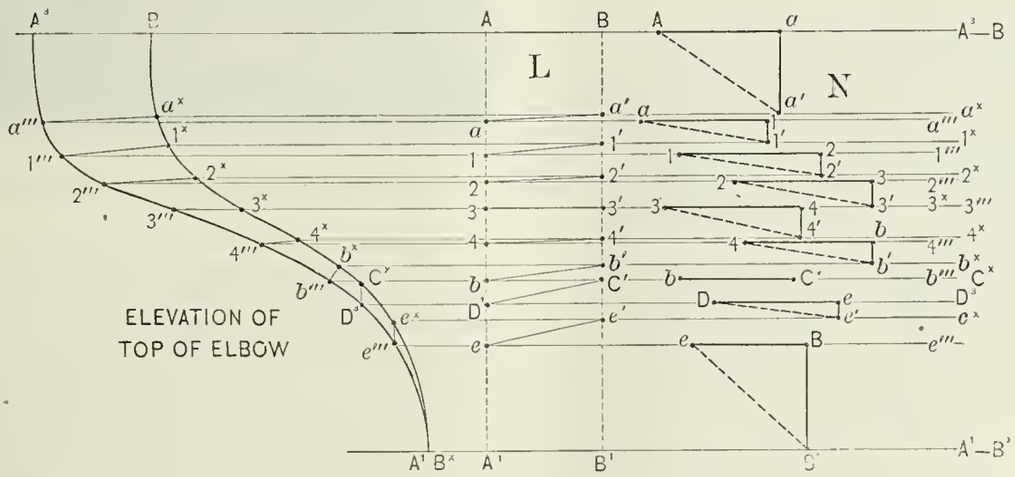

Fig. 4.—Part Elevation, with Diagram of Triangles on Solid and Dotted Lines in Plan, Fig. 2, for Top of Elbow.

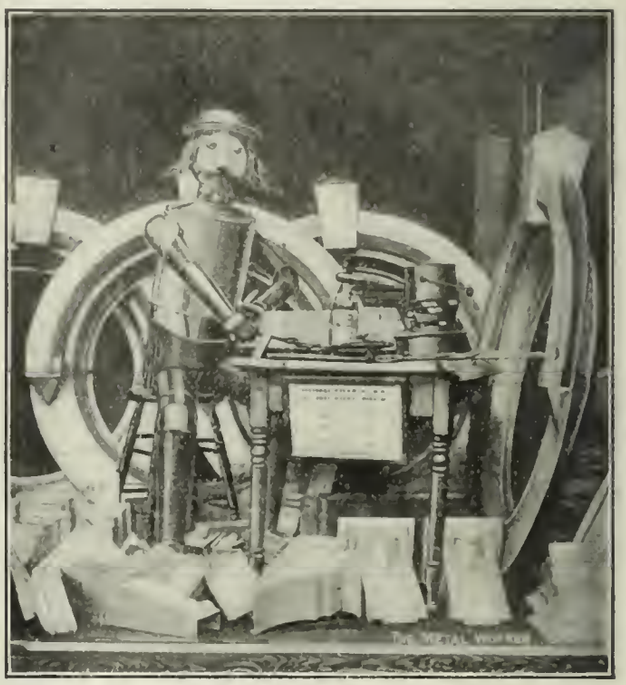
PATTERN FOR COMPOUND TWISTED ELBOW.

For the pattern for the bottom of the elbow draw any horizontal line, as D C of Fig. 5, equal to D C in plan, Fig. 2. Now take the stretchout of D^2 *c''* A^2 on the pattern for outside curve, which also equals C *c*° B° in the pattern for inside curve, and place it, as shown in Fig. 5 by D *c* A and C *c'* B, respectively, at right angles to D C. Now, with B as center and B° *a*° of Fig. 3 as radius describe the arc *a'* of Fig. 5. Then, with A as center and A *a'* in J of Fig. 2 as radius, intersect the arc *a'* of Fig. 5. With A as center and A^2 *a''* of Fig. 3 as radius describe the arc *a* of Fig. 5, which intersect with an arc struck from the center A with a radius equal to *a a'* in plan in Fig. 2. Proceed in this manner, using alternately as radii first the spaces on the lower curve in the pattern for inside curve in Fig. 3, then the lengths of the hypotenuses in J of Fig. 2, the lengths of the spaces on the lower curve in the pattern for outside curve in Fig. 3, then the lengths of the solid lines in

plan, Fig. 2, until the last line, D^1 C^1 of Fig. 5, has been obtained. A line traced through these intersections, as shown by D^1 C^1 2′ C D 2 D^1, will be the pattern for the bottom of the elbow.

For the pattern for the top of the elbow draw any horizontal line, as A B in Fig. 6, equal to A B in plan, Fig. 2. Now, with B a^x in the pattern for inside curve as radius in Fig. 3 and B of Fig. 6 as center, describe the arc a'. Then, with A as center and A a' in diagram N of Fig. 4 as radius, intersect the arc a' of Fig. 6. Then, with A^1 a''' in the pattern for outside curve in Fig. 3 as radius and A of Fig. 6 as center, describe the arc a. Now, using a' as center and a a' in diagram L in Fig. 4 as radius, intersect the arc a of Fig. 6, as shown. Proceed in this manner, using alternately as radii first the spaces on the upper curve in the pattern for inside curve of elbow in Fig. 3, then the lengths of the hypotenuses in diagram N of Fig. 4; third, the lengths of the spaces in the upper curve in the pattern for outside curve of elbow in Fig. 3, then, finally, the lengths of the solid lines in diagram L of Fig. 4, until the last line, A^1 B^1 of Fig. 6, is obtained. A line traced through these intersections, as shown by A^1 B^1 3′ B A 3 A^1, will be the pattern for the top of the elbow.

THE METROPOLITAN CORNICE AND ROOFING TRADE.



The cornice making industry around New York City has been in a fairly prosperous condition during the year of 1901. While some of the shops report that business has not been as good as it should be and that the competition of the smaller houses has taken away much of the profit, the majority say that business has been good, and that the year 1901 was a prosperous and successful one. It is, however, the general opinion that the percentage of profit on work has been reduced by competition.

At the present time there appears to be a fair volume of work in the shops, and the prospects for the new year seem to be bright, although it is hard to figure very far ahead in this line. An unusually large amount of work has been figured upon, but owing to the high prices of all building materials much of this work has not been started, as builders are waiting for prices to fall. One of the most prominent local contractors stated that over 80 per cent. of the work he had been figuring on had not started, owing to the high prices, and much of it, he thought, would not be begun until prices were lower. He added that regardless of this his shop had been kept full with the work that came along. Another contractor said that during the past three months plans had been filed in the Building Department for a much smaller number of large buildings than usual. He added that the public was not investing in buildings at this time, and that the only large work being done was the construction of public buildings, office buildings on which no expense was spared and other buildings that are absolutely necessary. From the present indications lower prices in building materials would mean a very large amount of work to be done.

During the past year there was but one labor trouble of moment, which is still on. It is not so much a question between employers and workmen as it is between two unions. The members of the employers' association had a contract with the cornice makers' union in reference to work which does not expire until September 1, 1902. The roofers demanded on September 1 last that they should be given some of the work now being done by the cornice makers, such as the putting on of corrugated metal siding. These demands the employers could not grant without breaking their contract with the cornice makers, and they were met with the rather unique proposition of either granting the demand of the roofers and breaking the agreement with the cornice makers, thus causing the latter to strike, or keeping the agreement and having the roofers strike. They chose what they regarded as the lesser evil, and the result is that the roofers have been locked out by the employers, who are putting the cornice makers at the roofers' work. While the work is not being done as rapidly as formerly, the employers are experiencing no trouble in getting all of that class of work done and in a fairly satisfactory manner. While several attempts have been made to bring about a compromise, one has not yet been effected.

THE CORNICE MAKER AT WORK.

The cornice maker at work was the subject of a window display exhibited last Labor Day at the hardware store of G. A. Gridley & Son, Elmira, N. Y. It was designed and erected by William H. Halliday, an employee of the firm, and shows a cornice maker sitting on a stool soldering a galvanized iron cornice bracket, the left hand holding the bracket in position and the right hand a soldering iron. In assembling the man, which was life size, the following articles were used: The

The Cornice Maker at Work.—A Window Display.

crown of the hat was a 3-pint basin, the rim a 7-inch stove pipe collar, the back of the head a jelly dish, the face a quart basin, the eyes were zinc can screws, the nose a coffee pot lip, the hair, mustache and chin whiskers were fine strips of sheet iron, the neck a 1-quart pail, the necktie a 1-inch strip of Russia iron, the body a 20-quart cream pail with cover, the trunk a sheet iron cooker, the shoulders were sugar scoops, the upper arms were of Russia pipe, the elbows 3-inch Russia elbows, the forearms were Russia pipe; the hands, 4-inch flat paint brushes; the thumbs, 1-inch round brushes; the thighs were Russia pipe, tapering 6 to 5 inches; the knees, 5-inch Russia iron elbows; the lower limbs, Russia pipe, tapering 5 to 3 inches, and the feet were composed of horse-radish graters.

On the table were a hammer, snips, a gasoline fire pot, &c. The background was galvanized iron circular windows, miters, dentals, brackets, &c., being scattered around on the floor. Every article used in the construction of the man and the display went back into stock. The bottle seen on the table is a bottle of mineral water and was placed there by some miscreant after the decorator had fled, and is a joke in itself, as who ever heard of a cornice maker taking a drink of mineral water!

We are indebted to George B. Blizard, Tin and Sheet Iron worker and Tin roofer, 108 and 110 Manton street, Philadelphia, for one of the wall calendars which he is sending out this year to his customers. On the upper part of the calendar is displayed a picture in colors of "The Old Mill," the calendar sheets being attached to the lower part, which also bears the name and address of the donor and reference to the lines of work which he is prepared to undertake.

WHAT SHOULD A CORNICE MAKER KNOW?

A correspondent writing from British Columbia in reference to the article in our issue of December 21, on "What Should a Cornice Maker Know," says that the difficulty seems to be in reading blue prints. Any good cornice man, he remarks, can get a thorough knowledge of blue prints by taking a course in the International Correspondence Schools. The writer states that he has taken such a course and knows that it is just what is wanted.

Fire Proof Metal Windows.

The Smith-Warren Company, 143 Federal street, Boston, Mass., have prepared a 40-page catalogue of the Smith patent fire proof hollow sheet metal window frames and sashes, which have been illustrated and described in these columns. These fittings are made in various styles, which are illustrated in the catalogue, both by sectional and front views. Special attention is called to the firm's automatic self closing device whereby the windows are closed automatically by the action of heat. A series of interesting half-tone pictures are given of a fire test recently made in Philadelphia with a brick building containing one of the Smith fire proof windows. The first picture shows the window open with a pile of oil saturated wood in front of it, ready to be ignited. The next displays the window in the act of closing 40 seconds after the match was struck to ignite the wood. The final illustration shows the window as it appeared, absolutely intact, after the fire had been maintained for a half hour on the outside, with the hose turned on to the window; after which the fire was ignited on the inside of the building and maintained for another half hour, and the hose turned on again. The company claim that windows made of their metal frames and sashes and glazed with wire glass are supplanting fire shutters in many places, being found absolutely fire proof, and at the same time affording free access for light. In addition to a general description of the company's metal windows, the book contains instructions for taking measurements, which it is necessary for the company to know in order to construct frames; also some full page illustrations of their work shops and letters from architects, insurance companies and other parties testifying to the efficiency of the company's system.

N. & G. Taylor Company.

N. & G. Taylor Company of Philadelphia, Pa., will move their general offices early in January to the Mariner and Merchants' Building, at the corner of Third and Chestnut streets, where they are having spacious offices fitted up for their use. This change is necessary for their rapid growing business in the enlargement and development of their tin plate plant, for their trade in open hearth soft steel sheets for stamping purposes, and for their business in plate, iron and steel. Their minor offices will be transferred to their tin plate works on Tasker street, in Philadelphia, where they are already making important additions and building a very large warehouse, fully equipped with electrical elevators for the rapid handling of their product. The box department and the black plate department are also being enlarged and another story added to this building. They are also enlarging their smelting works to meet the increased demand for their fine makes of solder, &c. They have occupied the property on Branch street since 1845, and are now giving it up simply to obtain larger and more convenient accommodations.

Since the opening of the day Cornice class at the New York Trade School, Sixty-seventh street and First avenue, New York, two pupils have been admitted to the course, whose names were not given in the list presented in *The Metal Worker* of December 14. The new students are Bernard Reynolds and Gustave Kretschmann, both of Brooklyn, N. Y. The class now consists of ten members, as compared with four members in last year's day class.

Death of James Hicks.

The death of James Hicks of Piqua, Ohio, which took place at the Waldorf-Astoria Hotel, New York, on December 24, caused a shock to his friends. Mr. Hicks had come to New York City to spend the Christmas holidays. A day or two after his arrival, while preparing to seal an envelope, he cut his tongue with the sharp edge of the flap. The injury was so slight that Mr. Hicks paid little or no attention to the matter until alarming symptoms developed, and it was found that he was suffering from blood poisoning as a result of the cut. The disease made rapid progress and he died within a few days of the injury. Mr. Hicks was a well-known steel manufacturer and was closely interested in the Cincinnati Corrugating Company and the Piqua Rolling Mill Company, manufacturers of sheets, both of which concerns were absorbed by the United States Steel Corporation. Mr. Hicks was in the prime of life and his unlooked for death is a matter of great regret to his many friends.

FLASHINGS.

A. A. Upson, one of the oldest retired businessmen of Cincinnati, Ohio, and who for upward of half a century was prominently connected with the Tin Plate and Sheet Iron trade of that city, died at home in College Hill, Ohio, on December 19, at the age of 86 years. Mr. Upson was a man of fine character, and was held in high estimation by all who knew him.

Frank Jarvis has resigned from the New Process Galvanizing Company of Niles, Ohio, to enter the employ of the Youngstown Iron & Steel Roofing Company of Youngstown, Ohio.

It is announced that the big new plant of the Youngstown Iron, Sheet & Tube Company of Youngstown, Ohio, will begin operations next Monday.

William B. Scaife & Sons Company of Pittsburgh, Pa., have been incorporated under New Jersey laws with a capital stock of $850,000, to manufacture Corrugated Sheets, &c. The incorporators are K. K. McLaren, Aug. S. Meeker and C. W. Perkins.

The American Rolling Mill Company have placed an order with Edward E. Erikson of Pittsburgh, Pa., for an additional Bar mill furnace for their plant at Middletown, Ohio.

W. C. Nimmo & Co., Baltimore, Md., dealers in Tin Plates and Metals, and roofers', tinsmiths' and stovemen's supplies, have favored us with one of the neat little vest pocket notebooks which they are sending out to their friends and customers. The notebook contains, in addition to a number of blank pages, several pages devoted to information that will be generally useful to businessmen. It also bears references to the firm's special brands of Terne Plates, including Nimmo Old Style, Sandow Old Style, Yale Old Style, Tuxedo and Rosedale Extra Coated.

H. J. Pratt & Co. of Springfield, Mass., have completed the Metal Cornice work on a new block built, in that city, by H. W. Cooley.

Henry Weyand, Waterbury, Conn., has the contract for the metal work on two new blocks of buildings being erected by Hotchkiss Brothers & Co., at Torrington, Conn.

The plant of the Parkersburg Iron & Steel Company, Parkersburg, W. Va., was put into operation December 18. Bernice Budke of Canonsburg, Pa., daughter of John F. Budke, christened the plant by breaking a bottle of wine over the main fly wheel.

We have received from W. F. Overly, manufacturer of Architectural Sheet Metal Work, Greensburg, Pa., a neat glass paper weight in the shape of a rose, and having the firm's name and address inscribed upon it in gold letters. The friends and customers of Mr. Overly who received this useful Christmas souvenir will no doubt greatly appreciate it.

Stowell Mfg. Company, Jersey City, N. J., manufacturers of fire proof Asphalt Roofing, Asphalt Paint, &c., are largely increasing their facilities, and are getting into

a position where they will be able to make prompt shipment of all orders.

A fire on December 25 did about $1000 damage to the plant of the Chicago General Tin Works, at 141 and 143 Ontario street, Chicago, Ill.

The Chicago Tin Can Company have been incorporated at Chicago, with a capital stock of $20,000, by Moses Giel, Aaron Adelman and Henry Cohen.

The Newport Rolling Mill Company, Newport, Ky., are about completing three new finishing mills and two cold roll mills, which they expect to have in operation about the middle of February, for rolling Steel Sheets of sizes from 10 gauge up, and from 42 inches wide to 120 inches long. They inform us that their mills have been running continuously for the past year, with but two weeks' intermission, and are full up on orders for the first quarter of 1902, they having turned down a large tonnage in the corrugating and roofing departments during the past three months.

The Iowa Can Company, Des Moines, Iowa, manufacturers of tea, coffee and spice Cans, &c., are in the market for presses, &c., for small work. The company were organized early in 1901 and began business in a plant on Third street. Increased business compelled them to seek larger quarters, and they have leased a building, containing about 40,000 square feet of floor space, which they are fitting up for operation.

It is stated by one of the directors of the United States Steel Corporation that production and sales of Tin Plate by the American Tin Plate Company for 1901 will amount to as much as during the year 1900. The strike this year had no more effect on output and sales than did the adjustment of the wage scale which closed the mills in 1900, so it is claimed.

The Youngstown Iron, Sheet & Tube Company will push work as fast as possible on the new blast furnace and open hearth steel plant, which are to be built at Haselton, where the Sheet and Tube mills of this concern are being built. It is probable the blast furnace will have a daily capacity of 500 to 600 tons, while the Steel plant is expected to turn out 600 to 800 tons of steel per day. It will be recalled that this concern recently increased their capital stock from $2,000,000 to $4,000,000. The new stock will be offered first to present stockholders and then to the public.

F. J. Spelbrink, who has represented Berger Bros. Company of Philadelphia in New York State for several years, has severed his connection with that firm, and will represent McClure & Co., Tin Plate manufacturers and dealers in Tinners' and Roofers' Supplies, of 211-215 Second avenue, Pittsburgh, and 115 North Seventh street, Philadelphia, in the same territory. Mr. Spelbrink is well and favorably known to the trade, and his friends will wish him full success in his new connection.

Iwan Bros., Streator, Ill., have opened a branch office for the sale of their specialties in charge of Charles Morrill, 277 Broadway, New York, who will carry a stock from which direct shipments can be made. The firm are manufacturers of Chimney Tops, Conductor Hooks, Pipe Hangers and other Hardware Specialties. They have just issued an illustrated circular giving a full description with illustrations of their Volcano Revolving and Ventilating Chimney Tops, their Sickle Conductor Hooks for brick or wood and their Perfection Conductor Pipe Hanger.

The trade will be interested in noting the ninety-third annual greeting of the old established Tin Plate and Metal house of N. & G. Taylor Company, Philadelphia, contained in another part of this issue.

On January 1 Buchanan-Foster Company, offices 724 Drexel Building, Philadelphia, Pa., succeeded Garrett-Buchanan Company in the Building and Roofing Paper business. The new company have purchased the mill and tar refinery at York Haven, Pa.

A report from Atlanta, Ga., states that deposits of asbestos have been discovered on the property of Lieutenant Wilmer O. Chrisman, near Atlanta, and that they will be developed.

FAREWELL TO 1901.

BY TINSMITH.

Good-by, Old Year,
With memories dear.
Now that you've past,
We wish you'd last,
Indefinitely.

Tho cash we made,
While yet you stayed,
Is quite a pile;
'Twill make us smile
Delightfully.

The outlook, too,
Into the New,
You helped to make—
So let us shake
Felicitously.

We pledge with zest,
To do our best,
To make your son
A great big gun;
Emphatically.

Good-by, Old "1,"
Your record's won.
We'll try, in "2,"
To outdo you.
Substantially.

New Publications.

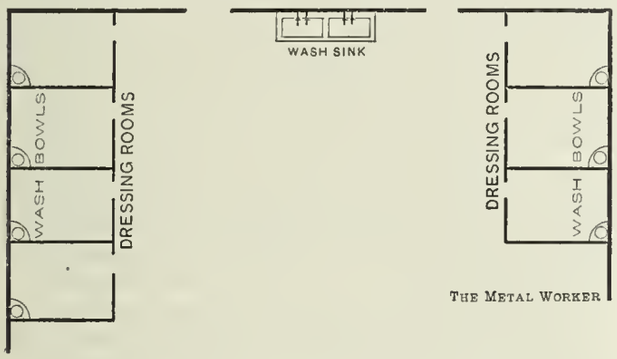
Linear Drawing and Lettering for Beginners. By J. C. L. Fish, Associate Professor of Civil Engineering in the Leland Stanford, Jr., University. Size, 7 x 10½ inches; 65 pages. Illustrated by four full page sheets and 50 figures. Bound in flexible cloth, with side title. Published by the author. Price, $1, postpaid.

Blank Book for Lettering, to be Used with Linear Drawing and Lettering. By J. C. L. Fish. Size 7 x 10½ inches; oblong in shape; 30 sheets ruled on one side for lettering practice. Bound in paper covers. Published by the author. Price, 25 cents, postpaid.

This work, as the title indicates, is intended for those desirous of acquiring a knowledge of linear drawing and lettering, and is comprised in four chapters. The first of these relates to instruments and materials, the second deals with a course in linear drawing, the third is given up to lettering, while the fourth presents an introduction to drafting. The author states that the work embraced in chapters two and three constitutes a course of 50 working hours in linear drawing and lettering in Stanford University as it has been given during the past eight years, and as preparation for the drafting in the courses in descriptive geometry, elementary machine drawing, surveying and graphic statics.

Marvelous, if true, says *Fire and Water*, will be the universal exclamation on hearing that a resident of Richmond, Ind., claims to have discovered a method, not of extracting sunbeams from cucumbers, but of storing the heat rays of the sun by a process the reverse of that employed for making ice. The inventor states that he has discovered a substance, which is abundant and cheaply produced—(something in the line of coal possibly, whose heat scientists ever is simply bottled up sunshine). It will absorb heat rays and hold them until driven out again. The process by which the heat will be driven out and the composition of the blocks are still secret.

We have received with the compliments of the Bourse of Philadelphia, a calendar for 1902, which is being distributed by the institution as a reminder of the fact that the Bourse offers an excellent meeting place for businessmen, and also that the building contains available office space as well as space for exhibiting goods for sale. The calendar is arranged with a brass ring for hanging, and with blank spaces against each date for notes.



THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WANTS HOT WATER SERVICE SYSTEM.

From E. M. C., Greenwich, Conn.—Will the readers of *The Metal Worker* aid me in concluding which is the best way to connect hot water pipes to the fixtures located as shown in the sketch given herewith? They consist of several wash basins located in the dressing rooms of a small theatre, and a large wash sink having two hot water faucets. I want to know how large a hot water boiler to use. I wish to heat it by means of a water heater or coil placed in a Wheeler furnace having a 34-inch fire pot. This furnace is used to heat the opera house. The furnace will be located about 10 feet below the fixtures.

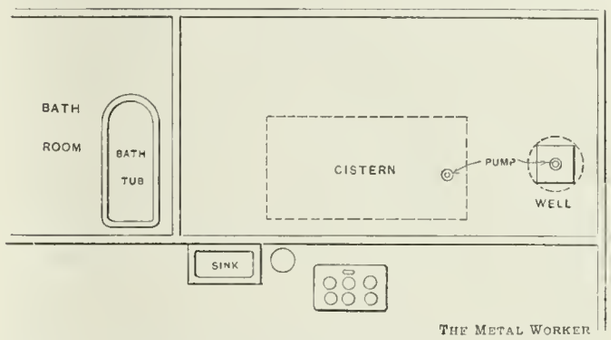
Wants Hot Water Service System.

QUESTIONS ON FURNACE WORK.

From Modest Yankee, Maine.—I have read with much interest the articles in *The Metal Worker* on furnace work and wish light on a few points. One is, How shall the capacity of a furnace be determined so that an average man can know that what he buys will have power enough and be able to judge of the correctness of the maker's rating?

There is need enough for us all to learn something on this point, for the manufacturers of furnaces will give the cubic feet a furnace will warm and the number of hot air pipes it will take care of, say, three 10-inch and two 9-inch hot air pipes. But when you figure up the two don't compare, and if you put in a furnace on their basis, look for trouble. They will send down a man to figure up a job for you, who will take the glass and wall surface and cubic contents into consideration, and if you are an old timer you will find out that you don't know anything. It seems that it will be but a short time before a boy, to learn the trade, will have to be a college graduate.

Another thing on which I would like to get the experience of furnacemen is the value of cone or flat top furnaces. Here in the East about all houses who do a large business use 45-degree ells and cone tops, whereas I have always got a better job and best results from flat tops. Not having a big head on me, however, I take it for granted the others are right.



FROST ON WINDOWS.

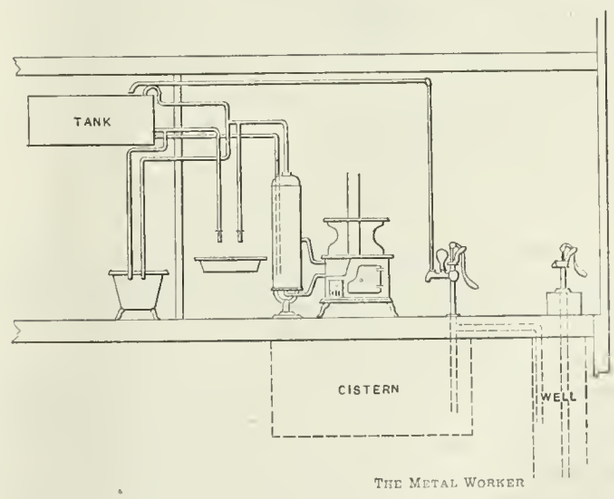
From J. U. & Son, Louisville, Ky.—I have noticed in recent issues of *The Metal Worker* arguments about keeping frost from windows. The one put forth by "R. C." in the issue of December 7 regarding the way the air circulates in a closed in show window is right. We have used two windows made as he describes and they have never frosted, although we have given the system a five years' trial. At the present time our weather here is 7 degrees below zero, and our windows are just as clear as in summer. Our show windows have holes in the top and bottom, and a feather placed in the window near the glass is carried by the ascending current of air to the top of the window.

TANK FOR KITCHEN BOILER SUPPLY.

From S. A. M., Mentone, Ind.—Will *The Metal Worker* kindly inform me how to arrange a tank for supplying a boiler which is to be connected with a water back in a stove? We have no water works and must use a tank to supply the boiler, and would like to have the tank located in the bathroom. I would be glad to have some idea how to do the work. The sketch (given in Fig. 1) presents the relative location of the kitchen, bathroom, cistern and well from which water can be drawn.

Answer.—From our correspondent's sketch we assume that the bathroom is on the same floor as the kitchen in which the stove is used, which would interfere with giving any considerable pressure to furnish a strong flow of water at the fixtures supplied. However, if a combination lift and force pump is used water can be taken from either the well or the cistern or both, as may be desired, by use of a stop cock on the suction pipe, and by means of stop cocks at the discharge water can be forced to the boiler supply tank, or can be drawn at the pump, as desired. If a pipe of about the same size as the suction pipe is used it will reduce the friction and force required to work the pump. It should be carried to the tank, which should be placed as near the ceiling as possible, and made as large as can be conveniently supported. The bottom of this tank should be at least 2 feet above the top of the boiler. The water should be taken from the bottom of the tank to the boiler, and a small pipe should be run from the tank near the top to the bathtub, so that when the tank is sufficiently full water flowing into the bathtub will give notice of it. A much larger pipe should lead from the tank at the same level out of doors, so that in case of overflow the surplus water can be discharged where it will do no harm. The pipe supplying cold water to the bathtub should be taken out of the side of the tank several inches above the bottom. The pipe which is to bring hot water from the boiler to the bathtub should run up to a hight equal to that of the cold water supply to the bathtub. This will make it impossible for all the water to be drawn from the tank, and to leave the boiler without a water supply. Where the tank is so slightly above the top of the boiler, very little water pressure will be exerted,

Tank for Kitchen Boiler Supply.—Fig. 1.—Plan Showing Location of Fixtures.



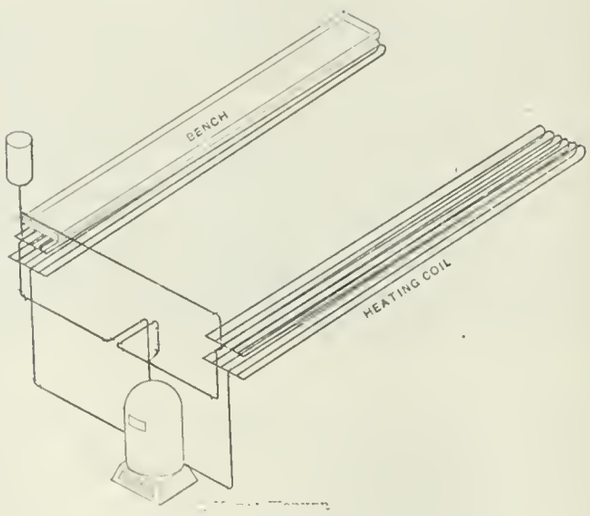


Fig. 2.—Elevation, Showing Piping.

and in case of heavy firing, steam is likely to be generated. In consequence, a small pipe should be carried from the highest point in the hot water pipe and run above the top of the tank, and the end turned down over it. This is to allow for the escape of steam and air. If the piping is arranged somewhat on the general plan given in Fig. 2 there will be no difficulty in securing satisfactory service.

HEATING A GREENHOUSE.

From H. N. S., Halifax, N. S.—I am called upon to heat a small greenhouse, 18 feet long, 12 feet wide, with a pitched roof that is 10 feet high in the center, falling each way to 4-feet walls on the sides. I desire to use a lot of 1-inch and ¾-inch pipe that I have on hand for heating it by means of a hot water system. I desire to connect the pipes with headers connected with the flow main from the heater, shown, and I should like to know what sized water heater I would require? How much should I run for the work to maintain a temperature of 60 degrees when the thermometer is 12 degrees below zero, the building being so situated that it has no protection on any side? Is it necessary to carry back the same number of pipes as is carried from the heater, area for area? Could I lead off with 1-inch pipes and return with ¾-inch, having the same number of each? Or, would it be better to use all of one size? I propose to place the heater under the building so connected with the chimney that there will

Heating a Greenhouse.

be no detriment to the plants from sulphur or gas, and expect with that I will get a good percentage of heat from the fire, though I do not calculate it will aid much in heating the greenhouse proper.

Answer.—In hot water heating it is necessary to have the return pipes of the same capacity as the supply pipes. The size of the boiler will depend on the amount of radiation needed for heating the greenhouse, which is governed by the glass exposure rather than by the cubic contents. We assume that the glass roof of the greenhouse will expose 288 square feet of surface, and that the ends of the greenhouse are also of glass, which would add 120 square feet of glass surface, making a total of 408 square feet of glass surface. If 1 square foot of surface is provided in the heating coil for every 2½ feet of glass surface exposed, it is probable that there will be no difficulty in raising the temperature of the greenhouse to 60 degrees, even with the mercury at 10 degrees below. By dividing the amount of glass surface by 2½ it will be found that about 165 square feet of heating surface will be necessary in the coils, and a heater rated to carry this amount of surface should be provided. Some benefit would be derived, both in economy of fuel and less care in firing, if a heater of 200 square feet capacity is provided, as it will also have to heat the surface exposed in the mains, and the fire can be regulated more readily to do the work. Both 1 and ¾ inch pipe are looked upon as rather small for use in heating greenhouses with hot water. However, if it is desirable to use this pipe return bend coils should be made so as to allow for the expansion and contraction of the pipe connected with the different headers. It would be better to use all 1-inch pipe on one coil, and all ¾-inch pipe in the other coil.

It may aid our correspondent in making these coils to know that 3 lineal feet of 1-inch pipe are required to expose 1 square foot of surface, and that 3.63 lineal feet of ¾-inch pipe expose 1 square foot of surface. If the coil on the more exposed side of the house is made to expose 100 square feet of surface and is made of 1-inch pipe, it would require 300 lineal feet. If the other 65 square feet of surface needed was made of ¾-inch pipe, it would require about 236 lineal feet of pipe. It is probable that the heating coils cannot be made more than 16 feet long, and by dividing the 300 feet of 1-inch pipe by 16 it will be seen that 20 lines of 1-inch pipe will be necessary in the heating coil, and by dividing the 236 lineal feet of ¾-inch pipe by 16 it will be seen that 15 lines of pipe will be necessary. If this is done a 1½-inch flow pipe should be carried from the boiler to the coil made of the 1-inch pipe exposing 100 square feet of surface, while a 1¼-inch pipe may be used in the coil made of ¾-inch pipe. If the flow mains are carried from the heater and connected with the flow headers on the return bend coils and the coils given a downward pitch to the return bends at the far end and a downward pitch carried back to the return header, where return pipes of the same size as the flow pipes are carried back to the heater, there should be no difficulty in the circulation.

A small pipe should be carried to the expansion tank from each flow main at the point where it connects with the flow header. This will serve the double purpose of allowing the air to escape from the heating coil and also to provide for expansion. A smaller pipe should be carried from the 1¼-inch pipe connected with the ¾-inch flow header. If one of the smaller cast iron water heaters that are on the market is used for this work it should have a grate at least 15 inches in diameter, and if the construction provides for the indirect passage of the products of combustion through the heater to the smoke outlet a decided advantage will be had in both efficiency and economy.

FINE PANTRY SINKS.

From J. Wilson, Stamford, Conn.—Do you know of any firm making butlers' pantry sinks of aluminum? For nice plumbing work there is nothing on the market suitable for a pantry sink. The tin soon wears off the copper sink; the porcelain sink looks very nice for a little while, but after long usage becomes rough and discolored. I think a heavy aluminum pantry sink would fill the bill.

Answer.—Owing to the various alkalis and acids that find their way to the pantry sink, aluminum has not been extensively used for plumbing fixtures. Where handsome and more durable sinks than tinned copper are desired, German silver sinks have been extensively used, as their cost is not greatly in excess of tinned copper sinks. Such sinks are made by the John Trageser Steam Copper works, 447 West Twenty-sixth street, and Henry Steeger, 143 East Thirty-first street, New York City.

WANTS INFORMATION ABOUT A SUN MOTOR.

From T. J. W., Holland Patent, N. Y.—If "G. K. E.," who asked in *The Metal Worker* of December 21 for information about a sun motor, will get a copy of the *Scientific American* of March 16, 1901, he will find a description of a solar motor made and operated in California.

WHERE SHOULD CHURCH FURNACE BE LOCATED?

From J. McD., New York City.—In answer to the inquiry of "M. Y.," in *The Metal Worker* of December 28, asking where a church furnace should be located, I would reply as follows: Under the conditions which are specified, place it as near the front door as you conveniently can. Take the cold air from anywhere in the church floor.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is very dull at former prices.

Copper is still weak and unsettled, with absence of business.

Pig Lead continues dull and weak.

Spelter is quiet and unchanged in price.

Nickel continues firm and unchanged.

Aluminum is active at former prices.

Tin Plates are quiet; jobbers' prices on Cokes and Ternes are lower.

Sheets are still in large demand with no change in prices.

Sheet Copper has been reduced 3c. per lb.

Sheet Zinc is unchanged and in fair demand.

Pig Iron prices are hardening and buying of Foundry Iron is active.

Scrap Iron is moving more freely and prices are firmer.

Scrap Brass and Copper is dull and weak.

Hardware is seasonably quiet, but prices remain firm in most lines.

Plumbers' Supplies are in good demand for the season, with prices firm, except for Brass Goods.

Wrought Iron Pipe continues firm in price and in good demand.

Cast Iron Soil Pipe prices are well maintained.

Registers are somewhat irregular in price.

Tinware is active, and an advance in prices is not unlikely.

Cistern and Pitcher Spout Pumps are strong and may be advanced.

Wire Nails show more firmness; demand is moderate.

Cut Nails are quiet and unchanged.

Wire continues in good demand; prices are not quite firm.

White Lead prices are somewhat irregular.

Linseed Oil is strong and slightly higher.

Spirits Turpentine is quiet and unchanged.

Old Rubber is dull and a shade lower.

METAL MARKET.

NEW YORK, January 3. 1902.

The year opens with the Metal markets in general in an unsatisfactory condition, comparing in this respect very unfavorably with the market for Iron and Steel products. The Copper market is utterly demoralized by the recent slump in that metal. Pig Lead and Pig Tin are both weak, and although the price of Spelter has been well maintained this metal also has shared in the general dullness which characterizes the entire market with the exception of Tin Plates and Sheet Iron, which are strong and in large demand, with an outlook for continued activity and good prices for at least the first half of the present year.

Pig Tin.—Scarcely any business in Pig Tin has been transacted during the past week. The closing of the London Metal Exchange for several days and the consequent absence of London quotations added to the naturally dull conditions, and the market was, for the most part, exceedingly quiet and uninteresting. Prices, however, have recovered slightly since the heavy break of last week, but the market closed easy. Jobbers' prices for Straits Pig in small lots were quoted at 24¼c. to 24¾c. per lb. Arrivals of Pig Tin during the month of December amounted to 3202 tons, and stocks aggregated 2331 tons. The total of Straits shipments to all parts in December was 4105 tons, compared with 3775 tons for December, 1900.

Copper.—The Copper market continues in an unsettled and unsatisfactory condition, with the expectation of a further reduction in the price of the metal. Nominally, prices are unchanged, but they are merely nominal. Rumors about heavy sales at lower figures than those made public were current during the week. These rumors, however, are not given much credence, for buyers, as a rule, are not taking Copper at any figure. It is the belief of the trade that the war among the leading Copper interests has only just begun and, considering the strength of the contestants, it is held that it will be a bitter one. The heavy accumulation of Copper that has caused all the trouble will, of course, figure largely in the strife. One of the chief factors in the struggle stated a day or two ago that cost of production could be considered as the only level of values; and, said he, "we can produce as cheaply as any one else in the business." He added significantly, "We can also use the big stock that every one has been talking about, and which we can afford to give away." Under the conditions there is really no basis of price, and it is almost impossible to give anything like reliable quotations. Lake Ingot is said to be selling in a retail way at about 14c. per lb., and Casting Copper at 13¾c., but these prices are merely incidental.

Sheet Copper.—A reduction of 3c. on the price of Sheet Copper was made by the manufacturers on January 2, bringing it to a base price of 18c. per lb.

Pig Lead.—Since the recent decline in the price of Pig Lead practically no business has been transacted. Consumers are taking the same stand as the consumers of Copper held for some time. They are not buying in advance, and are only taking just sufficient to meet their absolute current requirements. Consequently, there is a practical standstill in this branch of business. Jobbers quote small lots of American Pig at 4.45c. to 4½c. per lb.

Spelter.—This metal is also for the time being a drug on the market. There is practically no business, but prices are without change, good Western brands in small lots being quoted by jobbers at 4⅝c. to 4¾c. per lb.

Sheet Zinc.—The demand for Sheet Zinc is of fair proportions, and prices are unchanged. Jobbers quote 600-lb. lots at 6¾c., and smaller quantities at 7¼c. per lb.

Antimony.—There is no change in this metal. Cookson's in small parcels is quoted at 10½c. to 11c., and Hallett's at 8¼c. to 8¾c. per lb.

Nickel—Is unchanged, continuing on the basis of 60c. to 65c. per lb. for small lots.

Aluminum.—Manufacturers of Aluminum report a continued active and steady demand for this metal. Prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure rule at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates remains quiet and uninteresting, as is usual at this season of the year, although the smaller consumers are said to be purchasing rather more freely than usual. The American Tin Plate Company are taking orders for delivery the first quarter of the year at the figures ruling for some time past. No intimation has yet been given out as to the intentions of the company in regard to orders for the second quarter, but it is believed that no change is likely to occur. Jobbers' prices on Coke Tins, however, have declined more nearly to the normal, in consequence of a slacking of the stringency caused by the short supply of these Plates. American Bessemer Coke Tins, IC, 14 x 20, in small lots, delivered at New York and corresponding points, now rule at about $5 to $5.25 per box. Jobbers' prices are also about 50c. per box less for 20 x 28 Terne Plates. The year opens with favorable conditions for the Tin Plate trade. There is every indication of a continuance of active demand from all quarters. Prices are on a satisfactory basis, and stocks of Plates in both first and second hands are unusually light. The mills are still behind on their contracts and a

steady run is assured for the winter months at all the manufacturing plants.

Sheets.—While the situation in Sheets is not quite as strong as it was some time ago, owing to the coming into the market of some of the newly established mills, which are in some cases offering slight concessions in order to secure trade, the position in regard to supplies of Sheets is as yet unchanged, and retail prices show no softening. The mills have not yet caught up with their back orders, and most of them are well supplied with contracts to carry them through the first three months of the year. The demand for both Black and Galvanized Sheets continues active, and stocks of the more popular sizes are still light. Jobbers' prices are well maintained. No. 27 One Pass Cold Rolled Soft Steel Sheets are quoted at 4c. to 4.05c., and Galvanized Sheets at 65 to 67½ per cent. off the list. Considerable additions to the Sheet producing capacity of the country are gradually coming into operation as the new plants start up. The increase of output thus caused will no doubt have an important bearing upon the future of the Sheet market. But if the consumptive demand continues in as large volume as has been the case for the past few months it will take some time before the production of the Sheet mills outruns the consuming capacity of the country. Consequently, the opinion is generally held in the trade that Sheet prices are likely to hold up well, at least during the first half of the year, especially in view of the strength of the Pig Iron market and the scarcity and firmness of Steel Billets and Bars.

Chicago advices are as follows: New inquiries are coming up, covering large quantities, and the outlook is excellent for a continuance of activity. Prices show no indication of weakness. Small lots of No. 27 Black Sheets from stock are held at 3.50c. to 3.70c. Small lots of Galvanized are maintained at 70 to 70 and 2½.

Old Metals.—The scarcity of Pig Iron is causing more attention to be given to Scrap Iron, which is more active with prices comparatively firm, although without quotable change. Old Metals of other descriptions are dull and weak, especially Scrap Brass and Copper. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	11 c.
Light and Tinned Copper	per lb.	9½c.
Heavy Brass	per lb.	8 c.
Light Brass	per lb.	6½c.
Lead	per lb.	3¾c.
Tea Lead	per lb.	3¼c.
Zinc	per lb.	2¾c.
No. 1 Pewter	per lb.	16½c.
No. 2 Pewter	per lb.	9 c.
Tin Plate Scrap, per gross ton		$6.00 to $6.50
Wrought Iron Scrap, per gross ton		10.50 to 11.00
Heavy Cast Scrap, per gross ton		10.25 to 10.50
Stove Plate Scrap, per gross ton		8.00 to 8.25
Burnt Iron, per gross ton		5.00 to 5.50

THE PIG IRON MARKET.

The American Iron trade enters the new year with a prospect which could not be better. The tonnage placed for delivery during 1902 is very large, and there is such overwhelming evidence of unparalleled consumption that the continuance of the present very remunerative prices for the first six months is regarded as absolutely assured. The great majority of those who are connected with the Iron industry profess to feel certain that 1902 will go into history as one of its banner years. The present prices of Iron are not high, though they yield a very good profit to all well equipped, well managed plants. They are certainly not checking domestic consumption. Prices of Pig Iron are hardening, and yet the heavy buying of Foundry Iron, widely distributed, continues. A large number of good sales are reported from different leading distributing centers, and an increasing number of makers are showing a disposition to demand higher prices, so that the tendency is moderately upward.

New York.—The only sale of consequence in this district was of a lot of about 2000 tons, taken by a Connecticut foundry, one-half Southern and one-half Lehigh Valley Iron. The furnaces are having a good deal of trouble about fuel, but the founders, too, complain that they are embarrassed in this respect. Some of the Southern furnaces have advanced prices to the basis of $12 for No. 2 Foundry, but one large interest is still naming $11.50. We quote for Northern Irons: No. 1, $16.50 to $17.50 No. 2 X, $16 to $16.50; No. 2 Plain, $15.50 to $16; Tennessee and Alabama brands, No. 1 Foundry, $16 to $16.25; No. 2 Foundry, $15.25 to $15.75; No. 1 Soft, $16 to $16.25; No. 2 Soft, $15.25 to $15.50; No. 3 Foundry, $14.75 to $15; No. 4 Foundry, $14.25 to $14.50.

Chicago.—The output of the local furnaces is still heavily curtailed by the short supply of Coke. More furnaces have been banked in the past week, and unless the fuel supply speedily increases, others will follow their example. The quantity of Foundry Iron now being made in this vicinity is very small. This contributes to the strength of the Pig Iron situation, which is in such a condition that it would be strong even if the local furnaces were able to run as usual. The foundry trade is exceedingly active in all branches and the consumption of Iron is running beyond any previous experience. The foundrymen who are not receiving shipments on contracts made with local furnacemen are compelled to turn to the furnaces in other districts. The demand for spot Iron is heavy and excellent contracts were placed during the week. Some furnaces have advanced their price 50c. per ton during the week, but as yet enough sellers are found at the old rates to justify continuing former quotations. We quote as follows:

Lake Superior Charcoal	$18.50 to $19.25
Local Coke Foundry, No. 1	16.00 to 16.50
Local Coke Foundry, No. 2	15.50 to 16.00
Local Coke Foundry, No. 3	15.00 to 15.50
Local Scotch, No. 1	16.00 to 16.50
Ohio Strong Softeners, No. 1	17.60 to 17.85
Southern Silvery, according to Silicon	16.15 to 16.40
Southern Coke, No. 1	15.65 to 16.15
Southern Coke, No. 2	15.15 to 15.65
Southern Coke, No. 3	14.65 to 15.15
Southern Coke, No. 1 Soft	15.65 to 16.15
Southern Coke, No. 2 Soft	15.15 to 15.65

CHICAGO REPORT.

Scrap Iron and Steel.—Cast Scrap continues in excellent demand, but other kinds of material are quiet. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.	
Country Wrought Scrap	$11.00 to	$11.50
Machinery Cast	10.50 to	11.00
Malleable Cast	10.00 to	11.00
Stove Plate (free from burnt)	8.00 to	8.50
Burnt Iron and Grate Bars	5.50 to	6.00
Sheet Iron and Hoops	6.00 to	7.00
Plow Steel	.... to	10.00
Breaking Stock	9.00 to	10.00
No. 2, such as Shovels, Hoes, &c	.... to	7.00
Old Boilers—whole (Iron)	6.50 to	7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to	11.00
Old Gas Pipe and Boiler Tubes	10.50 to	11.00
Cast Borings	4.50 to	5.00
Turnings	9.50 to	10.00
Horseshoes	12.00 to	....

Old Metals.—The movement is very light and will remain so until Copper prices show some degree of firmness. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	10 c.
Copper Bottoms	9 c.
Copper Clips	10 c.
Red Brass	10 c.
Yellow Brass	7½c.
Red Brass Borings	9 c.
Yellow Brass Borings	6½c.
Light Brass	6¼c.
Pipe Lead	3.55c.
Tea Lead	3 c.
Zinc	3 c.
Tin Foil	20 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.

Old Rubber.—Business is dull. We quote as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	46.00	.....
Rubber Shoes	....	7 c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6¾c.
Black Rubber	....	4¼c.
White Rubber	....	8½c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—The demand has fallen off, owing to the prevalence of much milder weather. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo.	8.25	8.50

THE HARDWARE TRADE.

It is seldom the privilege of an observer of trade conditions to chronicle a more gratifying report than is called for at this time, when there is on the one hand the record of an exceptionally successful year, and on the other a hopeful looking forward to a continuance of existing prosperity. It will be noted that in almost every line sanguine expectations are expressed of a large volume of business the coming year and under conditions which should make it profitable to both merchants and manufacturers. The trade in most leading lines has been such as to reduce to moderate size the stocks of manufacturers and merchants. In fact, in not a few lines it is still difficult to keep up sufficient assortment to meet the needs of the trade. The trouble begins with the manufacturer, who often finds it hard to get material for his goods, and it passes down through the trade, making it incumbent for buyers to do a good deal in the way of hurrying shipments. Prices generally are very firm. The conditions which exist, both at home and abroad, encourage the expectation of a large volume of business during 1902. This seems assured unless some disturbing influence, of which there is no indication, unsettles the situation and induces some element of perplexity or alarm. Thus the old year has closed with a memorable record and the new opens with bright prospects.

NOTES ON PRICES.

Wrought Iron Pipe.—The base prices on Wrought Iron Pipe, Black and Galvanized, have not been changed since September 1, 1900. The list prices have not been changed since February 15, 1900. The prices with the jobbing trade varied considerably during the year 1901 more so than at any period before in the history of the Pipe industry, with the exception of 1899. The Pipe market in the Eastern section was in practically the same condition in the early part of January, 1901, as it is at the present time. Selling prices are practically identical, those prevailing at the present time being not more than 5 per cent. above the prices ruling in January, 1901. Rumors were rife the early part of the year regarding the Pipe situation. All through the month of February it was stated that as soon as the United States Steel Combination were put through the price of Pipe would be advanced. It was said that as the National Tube Company, which is one of the constituent parts of the United States Steel Corporation, controlled more than 90 per cent. of the entire producing capacity of the Wrought Iron Pipe mills of the country, it would be a very easy matter for them to advance prices. Another feature of the anticipated deal, which, it was expected, would affect the Wrought Iron Pipe market, was the fact that the United States Steel Corporation would control all the plants manufacturing Billets and Skelp, from which the independent Pipe manufacturers procured their supplies. The National Tube Company, it was expected, would make the price of Wrought Iron Pipe, and if the independent concerns did not live up to the price established by them then, it was argued, the Steel Corporation would put their prices for Skelp at such a high level that the independent manufacturers would be at their mercy. That there has been no cut in the price of Wrought Iron Pipe is due entirely to the fact that there is a great scarcity of it, and also to the fact that the National Tube Company had a prolonged strike at their mills during the summer. Owing to the heavy demand for Pipe and the pronounced scarcity of supplies premium prices were asked to the jobbers in the late summer, but supplies came in more freely along toward November, and prices gradually returned to the normal. They have remained unchanged since the latter part of November, and it is believed that they will so continue until the latter end of February or the middle of March. It is understood that the product of the leading interest is already sold up to that period, and that all sales have been made at the price which has been in effect for the past 15 months. The general outlook for business in Wrought Iron Pipe during the coming year appears promising. A number of new concerns are about entering the field, however, and keener competition may result. None of the independent mills, it is thought, will break the market.

Cast Iron Soil Pipe.—The condition of the Cast Iron Soil Pipe market has remained practically unchanged since the fore part of January, 1901. At that time the Cast Iron Soil Pipe Association was in its infancy, and, to a large extent, was merely an experiment. Since then, however, the association has improved, and to-day the Association of Soil Pipe Manufacturers is one of the strongest and most stable in the Plumbing Supply business. It includes all the Cast Iron Soil Pipe concerns of the country. There is only a difference of 5 per cent. in the manufacturers' prices to-day from those issued by the association on January 10 last. This advance was made in March, and the prices then issued have since ruled the market. The prices quoted by the jobbers all over the country are identical. On February 23 the list prices were standardized. The demand for Soil Pipe and Fittings was very satisfactory, and in good volume all through last year. The market is very firm at the present time, manufacturers preferring to carry their stocks through the usual dull season rather than dispose of them at concessions in price. A large trade is anticipated for the coming year, as it is expected that a good deal of building will be done over the country generally. The capacity of the foundries is large and in excess of the normal demand, and without agreement between them manufacturers' prices would easily become demoralized in presence of a dull market.

Enameled Bathtubs and Sanitary Ware.—The year 1901 was the most remarkable year in the history of the Enameled Bathtub business. Commencing with the first of the year the manufacturers standardized the lists and discounts of Bathtubs. On January 1, 1901, the Standard Sanitary Mfg. Company put into effect the high lists which had previously been used in the West. These included the lists on the unguaranteed brands and on the regular guaranteed brands. The prices on high grade and special brands remained unchanged. The adoption of the Western or high lists did not mean an increase in price, as the high lists were accompanied with correspondingly high discounts, which made the net equivalents the same as with the low lists and discounts which they superceded. Early there was a slight advance in Enameled Square Kitchen Sinks, Enameled Laundry Trays and Enameled Ware of all kinds. The demand and the increase in the cost of raw material was sufficient at that time to warrant the asking of better prices. A very pronounced scarcity of Bathtubs was developed during the year, and jobbers were put to considerable difficulty in securing goods to meet the demands of their customers. Prices to the retail trade were advanced 10 per cent. in June. There has been no change whatever since then. The trade have not asked for any new prices, being entirely satisfied to get the Tubs at any price. There seems every reason to believe that prices will remain without radical change during the ensuing year. The demand for Tubs to be used during the year 1902 is said to be so large that there will probably be little difficulty in maintaining present prices. All reports concerning Enameled Tubs indicate that 1902 will show the largest product of this class of goods ever put upon the market. A few new manufacturers in this line are preparing to start during the present year. There has been no change in the styles or general appearance of Tubs. It is said that the several new concerns which started up during 1901 are turning out fairly satisfactory ware, considering the small period of time in which they have been engaged in the business, and the slight experience they have had.

Sheet Brass, &c.—At a meeting of the principal manufacturers of Brass, held in New York on Thursday, January 2, a reduction was made in the price of Roll and Sheet Brass, Brass Wire and Rods and Brazed Brass Tubing, the discounts on which were placed as follows:

	Discount.
Roll and Sheet Brass	35 %
Brass Wire and Rods	37½ %
Brazed Brass Tubing	45 %

The reduction was made on account of the decline in price of Copper, but as the price of Brass has relatively been considerably lower than that of Copper, the reduction is naturally not as heavy proportionately as the decline in the raw material.

Registers.—The situation of the market for Hot Air Registers is not as satisfactory as manufacturers would desire. During the spring and summer months the market was in an unsatisfactory condition, with irregularity in prices and considerable divergence in the quotations of the various manufacturers. Competition of comparatively new concerns caused a lowering of prices on the common goods. On September 2 a higher list was adopted by some of the manufacturers. Others, however, together with a number of jobbers, continued the use of the old lists. At present there is no agreement among the manufacturers of Registers in regard to prices. On account of this lack of agreement and of the fact that the capacity of the manufacturers in this line exceeds the normal demand and that there is a large variety in the assortments and quality of goods, there is a good deal of unevenness in prices.

Tinware, &c.—The demand for Tinware, Galvanized Ware and other Sheet Metal household goods has been very active, especially during the past six months, and the great difficulty in obtaining supplies of raw material has contributed to a constant shortage of goods. The question of making deliveries by manufacturers has been of more moment than the question of prices. A continued large demand is anticipated during 1902, with prices no lower than those now ruling, but probably higher. There was talk in the trade this week of an impending advance in Tinware.

Pumps.—While there has been no formal agreement between all the manufacturers of Cistern and Pitcher Spout Pumps, their relations for some time past have been more harmonious than usual. Some reductions were made in the price of Pitcher Spout Pumps last year. The volume of business during 1901 was excellent, and the outlook for the first six months of 1902 is regarded with satisfaction. It is not unlikely that some advance will be made in quotations of Pumps if the price of Iron should move upward.

Building Papers.—Building Papers, including Rosin Sized Sheathings, Water Proof Sheathings, Asbestos Paper and Board, Deafening Felts, Tarred Roofing Paper, &c., were in excellent demand last year. The market has been an open one, and prices ruled low owing to active competition. Raw materials incident to the manufacture of Asbestos Papers have not declined in proportion to the selling prices of the finished product. The prospect is not encouraging for higher prices in the near future, but indications point to a large demand for 1902. It is not thought that there will be any reduction in prices of Asbestos Paper next year, or at least during the first part of the year, and that quotations will be higher rather than lower. There is a large demand for Asbestos Building Paper, which is expected to continue.

Wire Nails.—The absence of lower quotations on Wire Nails for the past two weeks has given the trade more confidence in the stability of the market. It is expected that some large orders will come into the market after the retailers have finished taking their inventories. The course of the market has justified the policy pursued by the trade in purchasing Nails in small lots, but it has resulted, almost universally, in small stocks throughout the country. The Nail market during the week showed its usual holiday dullness. Small lots of Wire Nails from store are quoted at $2.25 to $2.30 per keg. Only one change was made in the regular quotations in Wire Nails during the year. This was when an advance of 10 cents per keg was made by the leading interest. The increased quotation, while not formally changed, was not representative of the market during the latter part of the year, when it became disturbed by new competition. The demand for Nails during the year was very large, although orders in the closing months were, to a considerable extent, confined to small quantities.

Cut Nails.—The demand for Cut Nails is naturally light at this season, and has been curtailed to a greater extent than usual by the low price of Wire Nails. Representatives of the mills are adhering to the price of $2.25 for Nails from store. Jobbers in New York are asking the same price generally, but in some instances are selling 2 cents below these figures. An advance of 10 cents per keg in the price of Cut Nails was made during the year in two sums of 5 cents each. The demand for the past 12 months has been moderate, and the year opens with the market fairly steady, and in an unusual condition in that there is little, if any, difference in the price of Wire Nails, as compared with Cut Nails.

Old Rubber.—The market for Old Rubber is quiet at the present time. Prices rule slightly lower. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	5¼c.
Rubber Shoes, less than carloads, per lb	7 c.
White Wringer Rolls, per lb	7¼c.
Inside Bicycle Tubing, per lb	21½c.
Outside Tubing, per lb	6¾c.

White Lead.—The reduction in the wholesale price of White Lead in Oil is being held for the best known brands. In other brands there is also some irregularity in price. White Lead in Oil in a retail way is quoted at 6½ to 6¾ cents per pound. Only one change was made in the price of White Lead during the year, when manufacturers announced on December 20 a reduction of ½ cent per pound.

Linseed Oil.—The demand for Linseed Oil at the present time is confined to small lots. The market is firm at 57 to 58 cents per gallon for City Raw, Boiled Oil being 2 cents advance on Raw. The condition of the Linseed Oil market was unsettled and perplexing during most of the year.

PERFORATED METALS

STEEL, IRON, COPPER, ZINC, BRASS, TIN, and all other metals PERFORATED AS REQUIRED for

Grain Cleaning and Mining Machinery, Woolen, Cotton, Paper and Pulp Mills, Rice, Flour and Cotton Seed Oil Mills, Sugar and Malt Houses, Distilleries, Filter Presses, Stone, Coal and Ore Screens, Brick and Tile Works, Filters, Spark Arresters, Gas and Water Works, Oil, Gas and Vapor Stoves, Coffee Machinery, &c., &c.

Standard Sizes Perforated Tin and Brass Always in Stock.

The Harrington & King Perforating Co.,

Eastern Office, 284 Pearl St., NEW YORK. 217 North Union St., CHICAGO, ILLS., U.S.A.

CLASSIFIED LIST OF ADVERTISERS.

Acetylene Gas Burners.
Carroll, J. B., Chicago, Ill.

Acetylene Gas Generators.
International Heater Co., Utica, N. Y.

Aluminum Ingots.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Scrap Buyers.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Sheets.

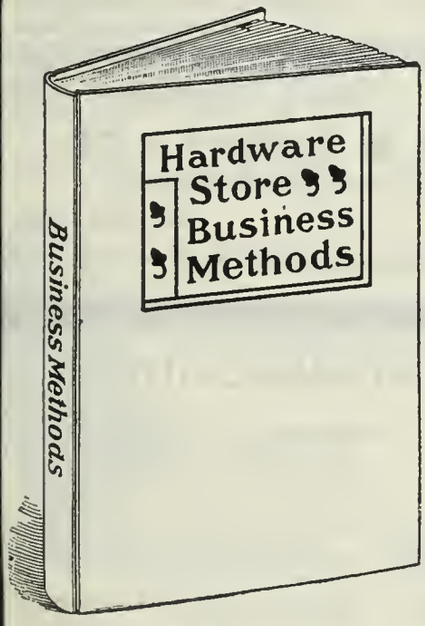
The Dealer who buys the White Mountain Freezer

is the dealer with a bank account.

He buys on the strength of established reputation and acknowledged worth.

He buys the right goods at the right price and sells them right.



He is the dealer to whom we want to sell and to whom we do sell.

He buys **The White Mountain Freezer** because he recognizes its merits and appreciates its possibilities as a trade and money maker.

He knows that each year the sale of **White Mountain Freezers** has increased; that it is now and has been for years the leading ice cream freezer of the world.

If you're not now selling **White Mountain Freezers,** we'd like you to begin this year. We'd like you to have our new catalogue, anyway. It is the most complete and attractive freezer catalogue extant. Write for it to-day.

The White Mountain Freezer Co.,
NASHUA, NEW HAMPSHIRE.

Are You Studying Your Best Business Interests. ?

Hardware Store Business Methods, now in its third edition, enlarged, is a useful hand-book for dealers, giving the most practical kind of information on store management, and treating subjects in which every hardwareman is vitally concerned. The book contains descriptions of methods successfully adopted by enterprising hardware merchants, and is designed as a guide and assistant for the merchant, the buyer, the salesman and clerk.

THE RANGE OF SUBJECTS IS INDICATED IN THE FOLLOWING LIST OF CHAPTER HEADINGS:

Rules and Regulations for the Hardware Store. The Hardware Buyer. Good Buying. Hints for Buyers. Securing the Correct Charging of Goods Sold on Credit. Conducting Sales to Avoid Oversights in Making Charges, Credits, etc. A Broad View of Stock Taking. Good Methods in Stock Taking. Suggestions in Regard to Inventory. A Price Book and Stock Directory. Prices and Catalogues. Arrangement of Catalogues and Price-Lists. The Accumulation of Dead Stock. The Treatment of Clerks. Waste in the Store and How to Avoid It. Keeping the Stock in Shape. Collecting Accounts. The Retail Hardware Merchant's Collections. Changing a Credit into a Cash Business. Sales Record of Cook Stoves. The Merchant and His Employees. How to keep the Store Neat and Clean. Cost Marks. Averaging Retail Profits. Changing Business Conditions and How to Meet Them. Starting in Business. Profit Figuring System.

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION

A USEFUL hand book for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder a cone, and other information relating to the work of a tinsmith.

Section 3 Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 98 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.

ART
IN
Metal Ceilings
GOTHIC STYLE.

One of the noblest styles of architecture and design is that known as Gothic.

The round arch style originated in France, the pointed arch being a later development.

From France, Gothic was introduced in England and Germany. It became extremely popular for churches, and is, perhaps, the leading one of the accepted styles for that purpose.

For the interior decoration of churches our Gothic design is particularly appropriate. The background is supplied with stucco effect. The ornamentation is elegant in simplicity and thoroughly in harmony with the characteristics of this historic style.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

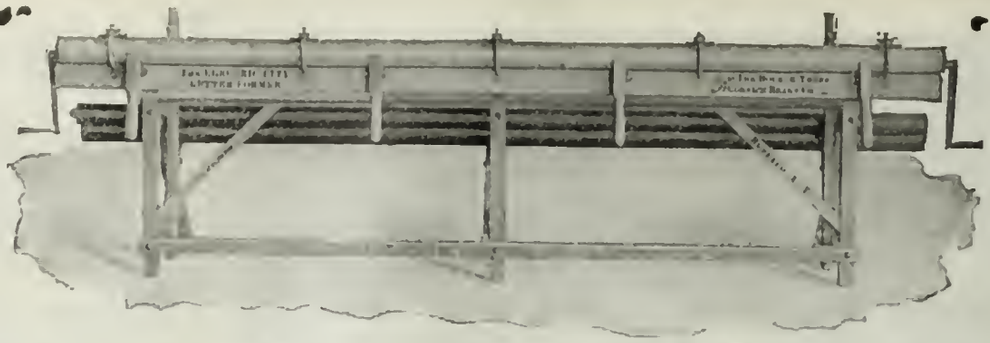
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials —13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections) —325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

New in Principle.

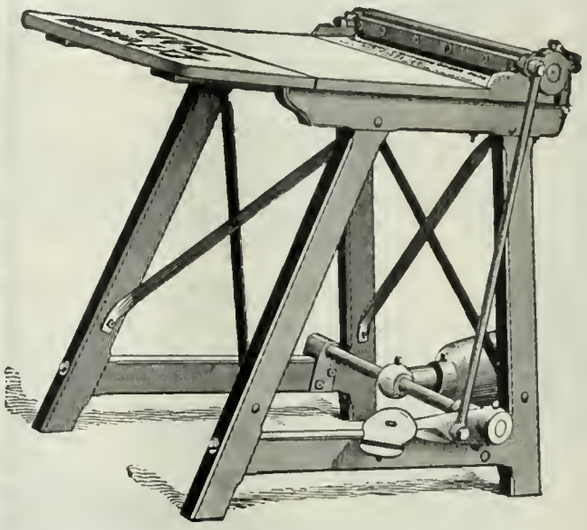
Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the head and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.



THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

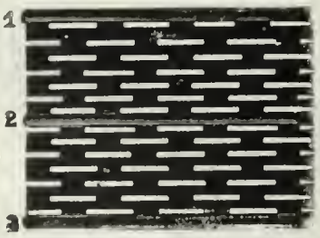
DANZER'S LIGHTNING EDGER.

PAT. NOV. 26, 1901.

Built in two sizes, 21 and 31 inches wide. Built for hand, foot and belt power.

It will edge 28 iron and tin for roll or flat seam roofing.

The cheapest, simplest and quickest edger on the market. Will edge from ¼ to ⅝ inch wide, and has edged a box of 20 by 28 tin in six and three-quarters minutes.



It is a time, labor and money saver.

SHOWING DOVETAIL KEYS.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

PRICE, - - $35.00.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well. A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times without sharpening. We have cut off such a bar 387 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of $1.00.
All good blades are stamped with a ★

Magee RANGES & HEATERS

Handle goods that the consumer knows and has confidence in,—that's one of the secrets of success

MAGEE FURNACE CO BOSTON

ROUND OAK

STANDARD of AMERICA

If it were possible, by spending more money, to Make a better steel range than the

Round Oak

we would do it.

As it is, we take every pains to build it right. We grind every door and draft to fit tight. We use three thicknesses of heavy asbestos board to insulate the oven, and we put it all around the oven flues—not only where it will show. It will hold fire; It will save fuel; and we expect it to outwear and outlast any range made.

It is a business getter and a business builder—good goods always are. These are facts for you to consider.

Estate of P. D. BECKWITH

Makers of Good Goods Only DOWAGIAC, MICH.

HB CHICAGO

It is far easier to effect a single sale than to gain a permanent customer. Glue them to you—make them stick—sell good goods—CARTON FURNACES, for instance.

CARTON "F"

WARM AIR FURNACE

There are many "talking points" about this heater.

One thing may be emphasized strongly:

No furnace in the market presents more efficient fire surface.

Look at the gas dome—a one-piece casting—no chance for an argument here.

MODERATE IN PRICE.

THOROUGHLY EFFICIENT.

International Heater Co.,

UTICA, N. Y.

BOSTON. NEW YORK. CHICAGO. DENVER.

The Largest Makers of Heaters in the World.

RELIABLE

Vapor Stoves and Ranges.

We have added several new patterns of Vapor Stoves and Ranges to our already large line for 1902, and in the future, as in the past, they will be beyond the reach of all competition. Dealers who handle the **RELIABLE** line invariably control the vapor stove business of their city. They never disappoint the user. Each stove sold will sell another! Testimonials of dealers who have handled them bear witness to their profit-making qualities.

Dealers should write us for a copy of our 1902 Vapor Stove Catalogue. Free for the asking.

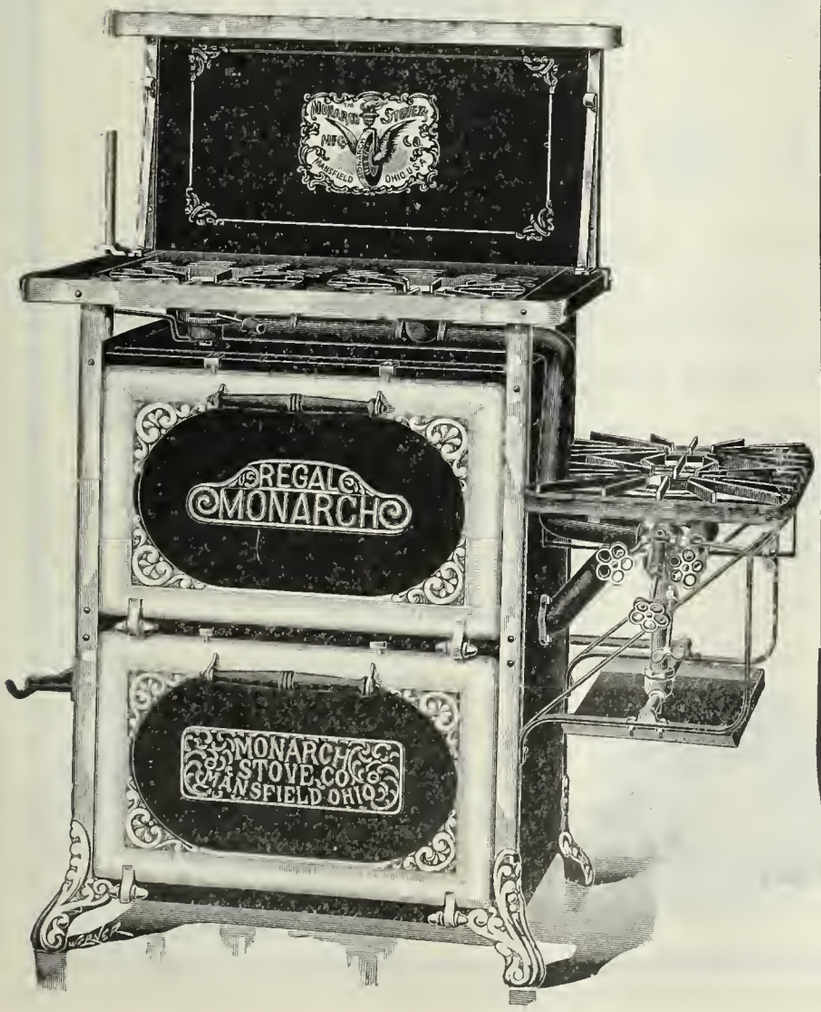
THE SCHNEIDER & TRENKAMP CO.

CLEVELAND CHICAGO SAN FRANCISCO

1802 — 1902

..Note.. the Difference.

There is relatively just as much difference between the



MONARCH LINE

and other makes.

Our line to-day is first and foremost in point of Excellence, Beauty, Finish and Practicability.

DEALERS

Make no error in handling this line for 1902 of Vapor and Oil Stoves and Asbestos Lined Ovens, as they, once shown, practically sell themselves. Write now to us direct or any of our Agencies. Your communications will have prompt attention, and be sure to get a copy of our new Catalogue.

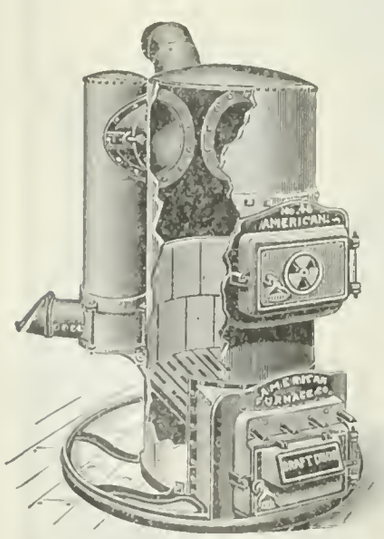
GENTLEMEN: I was talking to the man that we put the "DIGHTON" Furnace in for in August, 1900.

He told me that it worked fine and that he is well pleased with it. Please give me prices on them at once.

Yours truly,



J. O. SHRINER & SON.

Your Guarantee is Good,

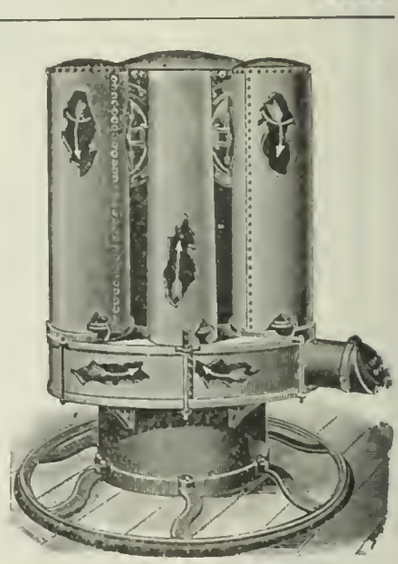
If backed up by our line. We make many kinds and sizes of steam and hot water boilers, and you as a dealer ought to know all about this line. Let us send you our printed matter and post you on the standard line. Write to-day.

KEWANEE BOILER COMPANY

KEWANEE, ILLS.

Burn Hard or Soft Coal, or Coke. Large Doors.

About Fire Pots.



We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

READ OUR OFFERINGS.

Special Advantages Over All Other Heaters.

OUR HEATERS are only 4 ft. 3 in. high, giving excellent elevation for Hot Air Pipes.

OUR HEATERS ARE ALL CAST IRON, no repairing of sheet iron drums necessary every few years.

OUR MANIFOLD TUBES are steel, ⅛ inch thick, and will wear for a lifetime.

OUR HEATERS are supplied with the most modern grates, perfect dumping and shaking. Each bar can be separately replaced.

OUR HEATERS are so arranged that they can be perfectly cleaned by any one, and in a few moments.

Equally Efficient with Hard or Soft Coal.

Our Heaters save the heat others waste up the chimney and send it through the house, therefore reduce coal bills.

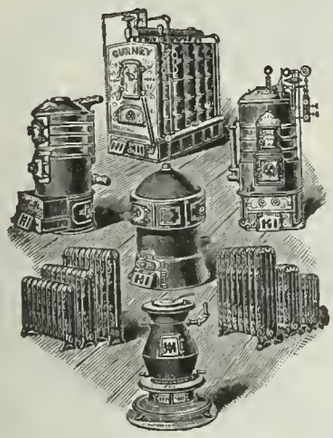
TO

FURNACE DEALERS

FOR 1902 We have a large line of **HOT AIR FURNACES** in styles and sizes which we will sell at reasonable prices. No order is too large or too small for us, and we are after business from any portion of the United States, no matter how near or far, and can name delivered price at any railroad station.

WE WILL SELL one furnace or we will sell one or more carloads and the buyer in every case is accorded thorough satisfaction and courteous treatment. WE GIVE EXCLUSIVE TERRITORY.



Dealers who have done unprofitable business in the past are requested to write us and we will show them how they can change their loss to profit, and make selling **FURNACES** a profitable and pleasant occupation.

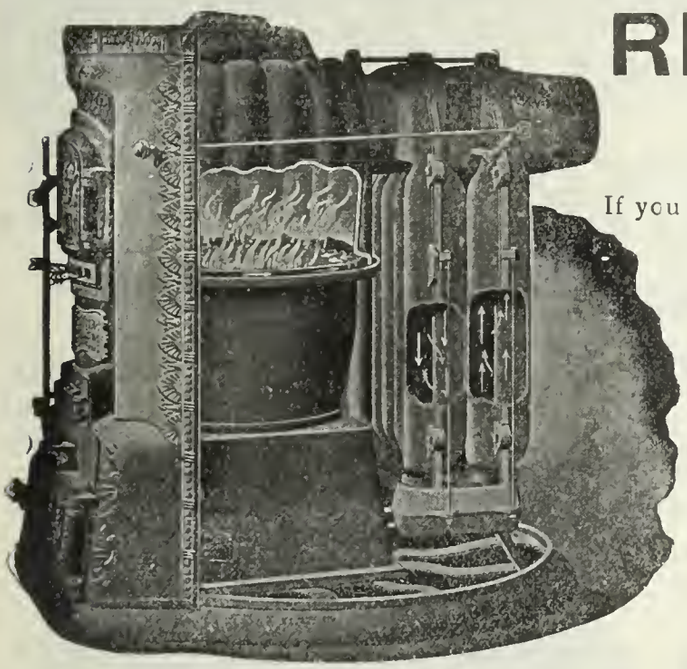
OUR CATALOGUE is an educator and in the interest of Good Furnace Work we want every dealer to have it, whether he sells our furnaces or some other furnace.

WRITE NOW for the exclusive Agency for **1902.**

GIBLIN & CO.,

UTICA, N. Y.

Even members of the same family are not always alike in virtue or ability, yet the



Gurney Heaters

Are of uniform excellence. In all of them the heating surfaces are so arranged as to produce a maximum of heat from a minimum amount of coal.

All are made from the best grades of iron, have the most efficient types of grates, and embody all the latest improvements. "Bright Idea," "Doric," and "400 Series" Steam and Hot Water Heaters are thus equipped. Sales of any of them will enhance your reputation. Would you become an agent? Let us hear from you.

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the *"CONTRACT AND ESTIMATE RECORD BOOKS"* come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

PORTLAND, CONN.

TIN LINED
IRON PIPE.
For Pure Water.
Avoiding without extra expense all danger of lead or brass poisoning.

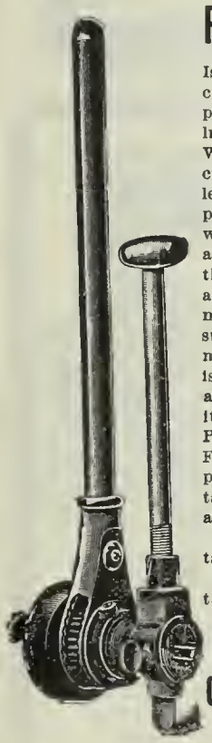
L. & R. PIPE.—Patented.

This lining cannot be torn from the pipe even by bending or by hot water.

LEAD LINED
IRON PIPE.
Made the Same Way.

LAMB & RITCHIE, Cambridge, Mass.

Look Out for Frozen Pipes.



$2.25 Net.

You should have ample facilities for quickly attending to calls of this kind. An extra torch or so costs little and will pay for itself the first co'd morn ing. REMEMBER, **your money back if not pleased** with any fire you purchase of our make. Jobbers sell them at factory price, or on receipt of $2.75 we will ship a No. 16 Torch by paid express. Our catalog is free. It's worth $$ to you.

CLAYTON & LAMBERT MFG. CO.,
Detroit, Mich., U. S A.

The Climax

RATCHET STOCK

Is an indispensable tool for conveniently threading Iron pipe in ditches, under floors in corners, over head, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers

The Metal Worker Index.

The Index to the reading matter of Volume LVI of *The Metal Worker* for July 1, 1901, to January 1, 1902, is now from the press, and will be mailed to those subscribers of *The Metal Worker* who will make application for it to the David Williams Company, 232-238 William street, New York City.

In order to relieve those who bind or file *The Metal Worker* of the trouble of future applications for the semi-annual Index, we have a special list to whom in the future the Index will be forwarded without further notice. Those who are now entered have had the Index mailed to them.

The Business Mortality of 1901.

The record of business failures in 1901 makes a favorable comparison with that of the preceding year. According to *Dun's Review*, 11,002 concerns suspended last year with an aggregate indebtedness of $113,092,376. These figures, while showing a slight increase in the number of failures over 1900, exhibit a gratifying decrease of nearly $25,000,000 in the aggregate of liabilities of failing concerns. The manufacturing disasters in 1901 numbered 2441, with an indebtedness of $44,960,983, compared with 2409 in the previous year, owing $51,702,142. Suspensions of traders last year were 7965 in number, with liabilities amounting to $52,060,640, as against 7844 in 1900, with liabilities of $59,415,592. Taking it all in all, the record of failures for 1901 gives that year a better showing than any previous year in the history of the country, for the defaulted liabilities were but 95 cents to each $1000 of bank exchanges, the smallest ratio noted since the record of failures was begun. Similarly, the ratio to the number of firms in business shows that the entire amount of defaulted indebtedness averaged only $94.33 for each concern, as compared with $119.63 in 1900, and, going back to 1893, with an average of $290.65. The increase in the number of insolvent concerns is by no means an evidence of unfavorable business conditions, but, on the contrary, is credited as a direct result of exceptional prosperity. A greater number of new firms were organized last year than in any previous year, owing to the larger earnings by men in salaried positions, and the better returns from small investments. Numerous new ventures of this class, backed by insufficient capital and with a deficiency of experienced management, had short lives, and in this way the number of small failures was swelled. These failures, however, had no particular influence, as many of them involved but a few hundred dollars each. A remarkable illustration of the essential stability of business conditions in 1901 is the fact that a violent upheaval was sustained in Wall Street in the early summer with practically no bankruptcies of any size, while such a series of shocks as the assassination of President McKinley, the failure of the corn crop, the serious labor troubles in the steel industry and lastly, the demoralization of the copper market, any one of which in ordinary times would have sufficed to cause disastrous complications in Wall Street, were experienced without serious effect on the general markets. In many respects the past year was one of the most remarkable in the history of the country and not the least in respect of the marvelous financial prosperity developed during its course.

Pensioning Employees.

One of the interesting announcements made at this time is that just issued by the American Steel & Wire Company. The officers of this company have taken steps to establish a pension department for the support of employees who have rendered the company long and faithful services and have attained an age or physical condition which necessitates a relief from duty. This is a particularly meritorious arrangement, as it does not contemplate the establishment of a pension fund derived from payments by employees, but will be wholly sustained by the company. It therefore differs from the system of pensioning adopted by railroad companies. It is an excellent example for other large manufacturing companies to follow. We are aware that it has long been the policy of numerous manufacturers to keep their old or incapacitated employees on their pay rolls, giving them duties suited to their age or condition, instead of turning them out to be at the mercy of the world and perhaps become objects of charity. This policy, however, is not usually carried out on a systematic plan. Therefore the action taken by the American Steel & Wire Company represents a decided improvement on what may have heretofore been done in this direction. It is an admirable idea to bring out this plan at the present time as one of the features of this era of prosperity. The liberal tendency of employers as indicated by such actions as this should go far toward establishing more friendly relations between capital and labor. If labor finds that it is remembered in times like these and given some share of the profits, the spirit of discontent, which is the prolific cause of dissension and disagreements, will be greatly allayed. It will not bring about the millennium, but will certainly have a good effect in preserving friendly relations.

The Outlook for Arbitration.

The approving attitude taken by organized labor in regard to the movement for arbitration of labor disputes initiated by the National Civic Federation at the recent convention in New York is a matter for congratulation, for it contributes one of the most hopeful factors to the industrial outlook of the country. One of the principal contentions for which organized labor has stood in recent years is the opportunity to bring its demands or grievances to the attention of the employers. This, as

President Gompers of the American Federation of Labor points out in a communication to the official organ of that body, the new movement unqualifiedly declared for and stands committed to. The conference of the Civic Federation and the establishment of its representative Arbitration Committee marked the successful issue of earnest and persistent efforts to bring about permanent arbitration of labor disputes, through the initiative of both the workers and the employers. That this movement will insure the entire elimination of strikes and lockouts from the industrial life of the country is not to be supposed, but that it will operate toward the better recognition by each side of the rights of the other cannot be doubted. The average workingman of to-day, and particularly the union worker, is of a sufficiently educated and intelligent type to recognize the truth that has been so generally lost sight of in the past—namely, that the interests of the employers and the employed are absolutely identical, and that the welfare of the one cannot be impaired without hurt to the other. Moreover, he has learned, by many sharp experiences, that strikes entail suffering and loss, even where they are, in their result, technically successful. There is no doubt that a strong feeling prevails among the workers in favor of the principle of arbitration as opposed to the crude and wasteful strike system, and that to labor as a whole, a method that will do away with the possibility of long periods of idleness and loss of income as the result of protracted labor disputes will be heartily welcome. At the same time union workers, as a class, are solidly against the system of compulsory arbitration, which some mistaken friends of labor are urging upon certain States for enactment into law. The contention is made that any system of arbitration should be one that is voluntarily accepted by both parties to the dispute, without the intervention of the courts, and that this is the only kind of arbitration that is calculated to secure permanent success.

The Fire Waste in 1901.

The years 1899 and 1900 were each marked by excessive fire losses in the United States, bringing disaster to many insurance companies and these concerns were called upon in the year just closed to suffer still heavier losses. According to the careful compilation of the New York *Journal of Commerce* the aggregate fire losses of the United States and Canada for the calendar year 1901 amounted to the enormous total of $164,347,000, or a little more than $1,000,000 in excess of the loss of 1900. Under these circumstances it is not to be wondered at that an abnormal number of fire insurance companies are reported to have retired from business last year, on account of the adverse conditions, among them being some of the older and more prominent institutions. The present outlook is said to indicate further withdrawals of insurance companies from the field during the first half of this year. The great increase in the fire waste of this country during the past three or four years is certainly alarming. Notwithstanding the improved facilities for the fighting of fire that have been introduced into our cities, the waste from this cause goes on increasing at a greater ratio than the increase of population. A comparison of the 1901 losses with those of the previous five years shows a marked increase in the damage caused by fire. For example, the average monthly loss in 1896 was $8,810,000; in 1897, $9,150,000; in 1898, $9,970,000; in 1899, $11,400,000; in 1900, $13,600,000 and in 1901, $13,700,000. The total for last year was, of course, greatly swollen by the conflagration at Jacksonville, Fla., which involved a loss of over $10,500,000, and other heavy losses were involved in the burning of the Board of Trade Building and many large stores at Montreal, Canada, and the destruction of a block of factory buildings in New York City. There were no less than eighteen separate fires during 1901 in each of which losses of over half a million dollars were incurred. Under these circumstances it is natural that the insurance companies should contemplate action in the direction of higher rates for insurance during the present year.

Growth of Small Jobbing Houses.

The great activity in trade in the past year has had important results in expanding jobbing interests at many points. This is illustrated in the growing importance of Duluth and the development of the jobbing trade in the West and Northwest generally, where many of the leading hardware and metal houses have enlarged their facilities. This is naturally the result of the existing prosperity, which causes growth in every healthy enterprise. The large establishments have not fattened, however, at the expense of the smaller ones, but the latter have likewise reaped a good share of the growth of the trade. The small jobbing houses which have been established at so many points in all parts of the country to serve the convenience of local dealers are increasing in importance, and their number is constantly being enlarged by the entrance into the wholesale field of establishments which had previously been devoted exclusively to the retail trade. This is a marked tendency of the times. It has been found profitable for the larger retail merchants to enter the ranks of the wholesale trade and employ traveling men to solicit business from smaller retailers located in their vicinity. This not only enables the house establishing a wholesale department to secure better prices from manufacturers, but it also proves a great convenience to small retail merchants, who are thus enabled to secure more prompt delivery of goods urgently needed, as they can draw them from stocks in their immediate vicinity. This feature in trade is not confined to the more remote sections, but has also developed in the cities, where the larger retail houses have found it practicable to cultivate a wholesale trade.

Editorial Notes.

The department store and the catalogue house continue to command the attention of the hardware trade, as they are a constant, and, in some sections, a troublesome form of competition. The associations of both jobbers and retailers recognize the situation, but are at a loss as to the measures to be taken to correct the evil or to check the tendency. An important event during the past year was the failure of a large Western catalogue house which had for years been a source of great annoyance both to wholesale merchants and retail dealers, as such houses cultivate a trade with consumers, thus injuring the business of retail merchants and diminishing the trade which they would otherwise have given to the jobbers constituting their regular source of supply. The manner in which this kind of competition is to be opposed, and the extent to which merchants may learn from or possibly imitate its methods, are questions which still await settlement.

Two marked developments contributed to make 1901 probably the most prosperous year in the history of California—namely, the remarkable advance in the utilization of power that once went to waste in the rivers descending from the high Sierra Nevadas and the wide introduction of native oil fuel. The mountain streams

are now being extensively used for the generation of electricity, which is carried hundreds of miles, giving power and light to the California valleys and even to cities on the coast. The cheap electric power thus obtained has so materially reduced the cost of mining and milling low grade ores that hundreds of abandoned mines were opened in the course of the year, and others greatly extended their operations. Manufacturing has also felt the stimulus of this cheap power, as well as of the cheap local oil fuel, which is rapidly superseding coal in California. These two factors, combined with the rapidly growing Oriental trade that has developed on the Pacific Coast of late years, and the general business prosperity that prevails in that section, as in other parts of the country, make the new year open very auspiciously for California.

The United States Leads.

The standing of the United States in point of national wealth as compared with her neighbors, and especially those of Europe, is illustrated by some interesting statements made in the "London Daily Mail Year Book for 1902," a copy of which has just reached the Treasury Bureau of Statistics. Under the head of "Wealth" the book places the United States at the head of the list of great nations, the figures of wealth being: United States, £16,350,000,000; United Kingdom, £11,806,000,000; France. £9,690,000,000; Germany, £8,052,000,000, and Russia £6,425,000,000. While the United States heads all of the countries in the matter of wealth, she shows the smallest national indebtedness, the figures being:

United States	£221,000,000
Germany	651,000,000
United Kingdom	706,000,000
Russia	711,000,000
France	1,239,000,000

The percentage of debt to wealth is given as:

	Per cent.
United States	1.4
United Kingdom	6.0
Germany	8.1
Russia	11.1
France	12.8

Under the head of "Fight for the Iron Trade," the publication referred to calls attention to the fact that the United States is now the world's largest producer of pig iron and steel, and says "It will be noted that the United Kingdom has lost ground, producing 396,749 tons less in 1900 than in 1899, the total for Great Britain being nearly 5,000,000 tons less than in America. An unsatisfactory feature in the British iron and steel trade is that in 1900 we imported more iron and steel than in any previous year, and exported less, while the United States exported more than ever." The tables accompanying this statement show the pig iron production of 1900 to be:

	Tons.
United States	13,789,242
United Kingdom	8,908,570
Germany	8,494,852
France	2,699,494
Russia	2,821,000

And of steel:

	Tons.
United States	10,087,322
Great Britain	4,901,054
Germany	4,799,000
France	1,624,046
Russia	1,494,000

A bill to regulate the price and quality of illuminating gas has just been introduced into the New York State Legislature by Assemblyman McCullough. This measure seeks to reduce the price of gas in New York City to 65 cents per 1000 cubic feet, the gas "to have an illuminating power of not less than 24 sperm candles—six to a pound—and burning at a rate of 120 grains of spermaceti per hour, tested at a distance of not less than 1 mile from the place of manufacture, by a burner consuming 5 cubic feet of gas per hour."

PRICES OF STOVES STIFFENING.

Recently we gave notice that an advance of 5 per cent. in the price of stoves had been made in the West. This action stimulated the stove manufacturers of Eastern Pennsylvania to profit by the example set, for at a recent meeting an advance of 5 per cent. in the price of stoves, to take effect on January 1, was made by them. So far, no evidence has reached us of a similar course being pursued by the up-State manufacturers of New York, who have held meetings frequently at the Waldorf-Astoria in New York City, nor has the apathy which seems to have seized the body of manufacturers which has hitherto met at the Astor House been shaken off to the extent of making an effort to adjust their prices in accordance with the recent increases in the cost of materials.

Notwithstanding that the year 1901 has been considered a good year in many other lines of trade, some stove manufacturers are emphatically of the opinion that the profit derived from the manufacture of stoves that have been sold in New York has been by no means satisfactory. It is also noted that the distribution of stoves in New York City and vicinity has practically gone from the old time stove dealer to the department store, the furniture dealer and the installment house, some houses stating without hesitation that 75 per cent. of the names of buyers in New York City on their ledgers are of this class. The salesmen have also begun to remark that there is a scarcity of stove dealers in New York City. Whether the contention is true that New York is the dumping ground for the surplus stove stocks from all sections of the country at whatever price can be secured, or whether the new distributers are more shrewd in their buying than the old time stove dealers, is a problem the solution of which is often discussed.

THE AMERICAN STOVE COMPANY.

We recorded in a recent issue the incorporation, under the laws of the State of New Jersey, of the American Stove Company. Since that time the capital stock of the corporation has been increased from a nominal figure to $5,000,000. A meeting of the new company was held in Chicago on Monday, January 6, when representatives of the following concerns were present:

The Ringen Stove Company, St. Louis, Mo.; George M. Clark & Co., Chicago, Ill.; the Standard Lighting Company, Cleveland, Ohio; the Dangler Stove & Mfg. Company, Cleveland, Ohio; the Schneider & Trenkamp Company, Cleveland, Ohio; the Quick Meal Stove Company, St. Louis, Mo.; the National Vapor Stove Mfg. Company, Lorain, Ohio, and the Monarch Stove & Mfg. Company, Mansfield, Ohio.

At this meeting the organization of the company was perfected by the election of 17 directors, who subsequently elected the following officers:

President, C. A. Stockstrom, St. Louis, Mo.

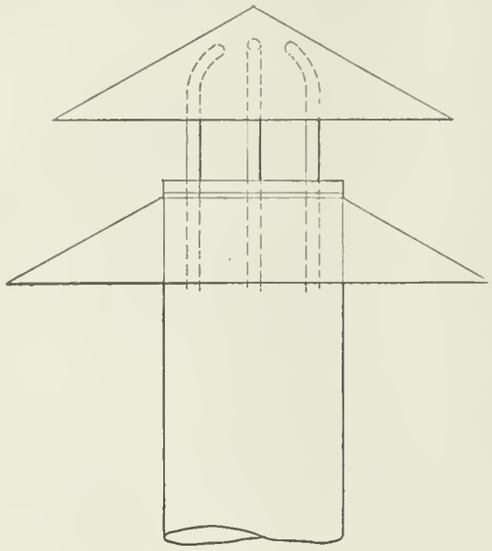
Vice-Presidents, George M. Clark, Chicago, Ill.; D. A. Dangler, Cleveland, Ohio; F. L. Alcott, Cleveland, Ohio.

Secretary, H. J. Trenkamp, Cleveland, Ohio.

Treasurer, George F. Fisk.

F. L. Alcott was elected as general manager of the five plants in the Cleveland district, and O. P. Moon as assistant manager at the other plants, which are located, one at Harvey, Ill., and two at St. Louis. We understand that the Harvey plant will be managed by George M. Clark, and the St. Louis plants by Louis Stockstrom.

The concerns whose names are given above practically control the manufacture of gas ranges, gasoline and oil stoves, which are made principally under United States patents owned by the new company.



The Monarch Stove & Mfg. Company of Mansfield, Ohio, state that they have added a number of patterns to the Monarch line, including a complete line of Wickless Blue Flame Oil Stoves with student lamp construction, so that the Monarch line for 1902 will be the most complete they have ever gotten out. The company also state that their territory will be more fully covered by their salesmen than ever before in the history of the concern.

ROSINHEAD'S REASONINGS ON SMOKY FLUES, OPEN GRATES AND FIRE PLACES, &c.

BY OLD ROSINHEAD.

I am on the sick list for a few days, and as the weather is cold I have to keep in by the fire, so will take advantage of the fine opportunity to write a few lines for *The Metal Worker* on the above subject.

On a damp, dismal day, one often hears the expressions, "How heavy is the atmosphere," or "The smoke is all coming to the ground," "The air is awfully heavy" and such like observations. According to my deductions from observation I am inclined to the opinion

Rosinhead's Reasonings.—Fig. 1.—A Tested Chimney Top.

that that theory is wrong. One may say with equally as much truth that the oil is heavy when seen floating on top of water, while one thing is certain—the water is the heavier of the two.

There have been so many queries in the Letter Box about smoky chimneys of late that I thought it might not come amiss to express an opinion or two on the subject. Down drafts are produced by three several causes. A flue connecting with open fire places and grates is more susceptible to down drafts than a flue with a stove attached. A continuous smoky flue indicates that the flues in the stove, if a stove connects with it, are stopped up, or else the chimney flue has got clogged, or is improperly built. Several years ago I worked on a flue

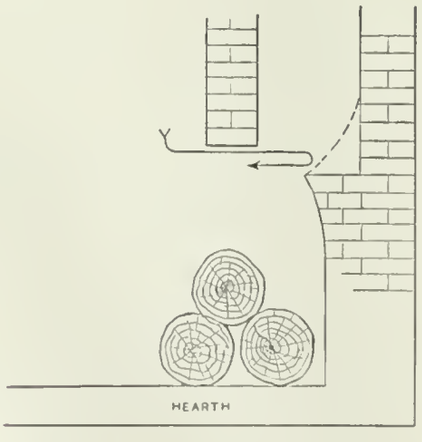


Fig. 2.—A Construction that Produces a Down Draft Effect.

that, at the point where it passed the second floor grates, had been narrowed up until the opening only contained an area of 8 square inches. I cut out the brick work and enlarged the passage to 64 square inches.

I cannot see, to save my life, why people in building houses for themselves want to put in grates. Some say they are healthy. If so, I cannot see it. When there is no fire there is always a draft of cold air coming down through the flue, and out into the room in a continuous stream. When you have a fire as fast as the heat radiates a few feet out into the room it turns back and enters the flue over the top of the fire and out in the open air it goes. I am an old bachelor and occupy rented apartments with a grate, and am writing this with my feet up into the fire. I have manufactured myself an anti-friction, ball bearing paper pin wheel, such as children play with in the streets, and have suspended it

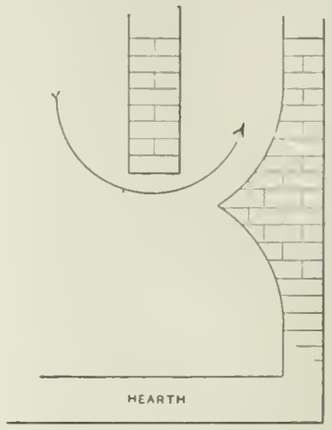

Fig. 3.—A Better Construction.

on a wire in front of the top part of my grate. It is now making an average of about 100 revolutions a minute, and when I open the doors instantly it speeds up to 500 revolutions. Very healthy to sit before a hot fire and have shafts of cold air, like Roentgen rays, pierce you through the back and then escape with some of the heat from your body into the flue over the top of the fire, and with the aid of the fire's heat, climb out to the top of the chimney. Very healthy indeed. I expect, with such treatment, I will not require a doctor at all.

The principal causes of down drafts, puffs, &c., are trees and walls of adjoining buildings projecting to a higher altitude than the top of the flue. The remedy is either to extend the flue, with brick or otherwise, above

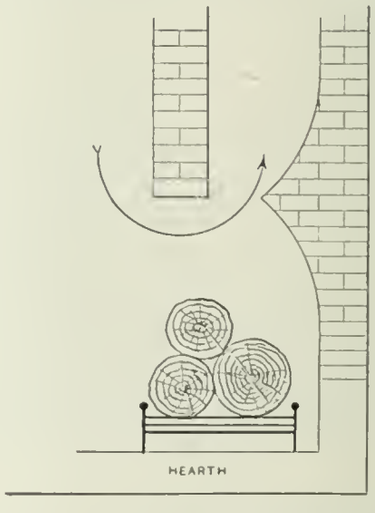

Fig. 4.—The Correct Construction.

all adjacent surrounding obstructions, or put on a ventilator cap of some kind or other. The common cap, with one plain windguard, wider than the cap itself, as shown in Fig. 1, surpasses anything extant. I have placed such on flues, right up against walls that projected three stories above, and have had no trouble afterward. The course of the arrows indicates how the currents slide away from the opening.

Some grate flues are supposed to have a down draft when they have not, and Fig. 2 shows how this can be. I have remedied this defect, as shown by the dotted line, by slipping a heavy curved piece of sheet iron in on the shelf behind, and on the top of the grate back. The construction, shown in Fig. 3, is better, but I believe that shown in Fig. 4 is best, although it is not apt to radiate as much heat. The throat should be narrow in order not to admit more air than the flue can carry up. The gases dodge around the point of the throat rapidly, but after they are past they move more sluggishly. Yet there is

no danger of their coming back, as the gases immediately behind push them on. Openings into the flue should not be narrowed up, as shown by the dotted line, but by the slanting solid lines in Fig. 5.

The great trouble with grates and fire places is that the opening permits so much air other than that which is required for combustion of the fuel, to crowd itself into the flue, that the space required to carry off the gases is limited to less than that which is required for the purpose unless the construction makes it easier for the gas to escape than for the air to rush in. This is the

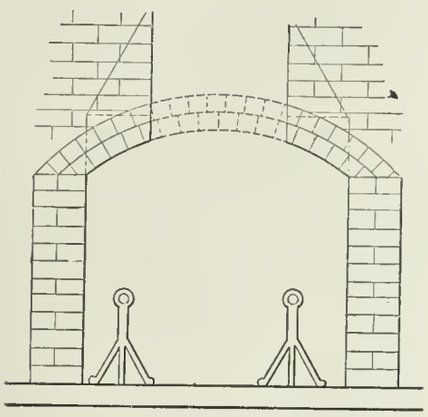

Fig. 5.—Connection of Fire Place Flue.

warm air of the room, which is needed for comfort, and its escape to the end of ventilation is what some people call "healthy."

Phillips & Buttorff Mfg. Company.

The Phillips & Buttorff Mfg. Company of Nashville, Tenn., have issued from the press what is known as Catalogue No. 120, relating to the leading lines of stoves, ranges and heaters which they are prepared to furnish. Within the covers of the work are shown a number of new designs, which have been brought out to meet well defined requirements of the trade. Among the opening pages attention is given to the National steel range, embodying the modern improvements, and offered in a variety of sizes, some of which are provided with double and triple ovens. Among the cast goods are various lines of cook stoves and ranges, while the heaters are represented with the Centennial soft coal parlor heater in the leading place. An extensive assortment of cheaper goods, including cottage parlor, Franklin, globe, cannon, air tight, box and laundry stoves are also presented. Miscellaneous goods and a comprehensive index complete the catalogue. The company state that they issue a number of departmental catalogues covering various classes of goods which they manufacture in extensive variety.

Accompanying the catalogue is a little pamphlet of a size convenient to carry in the pocket, and devoted largely to recipes for the household. These have been compiled by Mrs. Helen Armstrong of Chicago, and were used by her in connection with lectures on culinary art, the demonstrations being made on the company's National steel range. As might naturally be supposed under the circumstances, incidental reference is given to the range mentioned.

The Littlefield Stove Company, Albany, N. Y., have distributed a circular, intimating that a person cannot buy a Stove wisely until he has read the company's catalogue of West Shore Ranges, which are manufactured in great variety and adapted to meet extensive requirements. The point is made that the writer of the 48-page catalogue knows a great deal about Ranges, and the matter is presented in such shape as to cover the essential points about which both dealer and consumer should be well informed. In connection with the numerous illustrations are to be found prices for the various sizes. The company are also sending out under the title "Words of Wisdom" a 32-page pamphlet, which is made up, for the most part, of recipes for the household. A few pages are devoted to the West Shore Range, which is shown in several varieties.

TRAVELING STOVE SALESMEN FOR 1902.

We present below a list of the traveling salesmen for the current year of some of the stove manufacturing concerns of the country:

MONARCH STOVE & MFG. COMPANY

of Mansfield, Ohio, will be represented by C. E. Bartenbach and George N. Martin, who will travel in Ohio; N. S. Joslin in Indiana and Eastern Illinois, D. W. Burns in Michigan and M. F. Stellwagen in Wisconsin. Bartlett & Norris of Lincoln will look after the company's interests in Nebraska, Northern Kansas and the Black Hills; the Newby Stove Repair Company of Kansas City, Mo., in Southern Kansas and Oklahoma; the Kellogg & Stokes Company of Denver in Colorado and Utah; W. B. Gruenhagen of St. Anthony Park, Minn., will cover that State, North Dakota and Montana, and Gurney & Co. of Boston will supply the demands of the New England trade.

New York State, Northern New Jersey and Western Connecticut will be supplied by the company's New York branch house at 284 to 286 Pearl street, A. L. Canfield, manager. Eastern Pennsylvania, Southern New Jersey and the South Atlantic States will be supplied from their Philadelphia branch at 107 North Second street, A. H. McAdams, manager. Eastern Pennsylvania will be supplied from their Pittsburgh branch, 203 Wood street, R. E. Edmonds, manager; and Southern Ohio, Southern Indiana, Kentucky and Tennessee will be covered by the company's agents, H. R. Bruce & Co., 419 Pike Building, Cincinnati, Ohio.

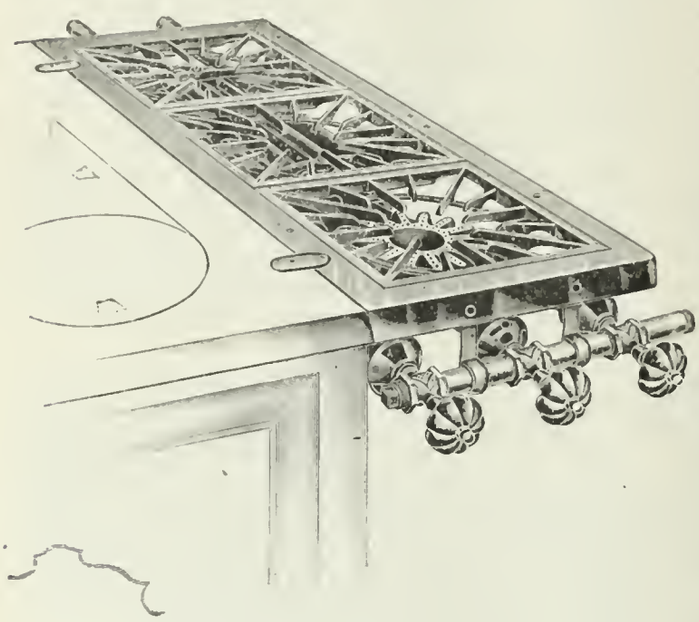
THE ROUND OAK STOVE WORKS

of Dowagiac, Mich., have arranged for the following traveling salesmen to represent them in the territory mentioned: A. E. Rudolphi in New York and the New England States, John A. Howard in Ohio, W. T. Leckie in Michigan and Indiana, Robert R. Elliott in Illinois, George T. Adams in Wisconsin, Minnesota and the Dakotas, John L. Parker in Iowa, Claude L. Hayden in Missouri, Colorado and the Pacific Coast and Fred. D. Stebbins in Nebraska, Kansas and Oklahoma.

GEORGE M. CLARK & CO.

of Chicago will be represented as follows during the coming year: Fred. K. Wells in the Eastern Coast States, W. G. Vought in New England and New York City, S. W. Lucas in Pennsylvania, Eastern Ohio and Wisconsin, C. T. Mason in Western Ohio and Indiana, Geo. E. Harris in Michigan, John C. Buckley in Illinois and Missouri, C. H. Macbeth in Iowa, J. H. Batchelder in Chicago and vicinity, Axel Gutsch in Pacific Coast and H. W. Peak in Texas.

THE ECLIPSE STOVE COMPANY



of Mansfield, Ohio, have selected the following salesmen to cover the territory named during the year 1902: H. D. Bell in Illinois and the city of St. Louis, J. C. Bump in Wisconsin and the Peninsula of Michigan, V. S. Hostetter in Indiana, C. A. Munsell in Ohio, E. H. Fay in Michigan, W. L. Dobson in Maryland, Delaware, Virginia, West Virginia, Southern Pennsylvania and other Eastter territory and J. A. Pinkerton in Iowa.

The company's Northeastern office and repository at St. Anthony Park, Minn., will continue under the management of W. H. Gruenhagen, and their Omaha branch and repository for supplying the trade in Nebraska, Western Iowa and South Dakota will also be continued during 1902.

The members of the office force of the Joliet Stove Works, Joliet, Ill., were given a very pleasing holiday present by their employers, consisting of a trip to Chicago as the guests of the company. Free transportation was furnished, as well as seats at Powers' Theatre, and a fine dinner.

Gas Attachment for Coal Ranges.

The convenience of gas for cooking has led many who must use a coal range for their heavy work to use gas cooking apparatus to supplement their coal ranges or when there is no coal fire. The accompanying illustration shows a coal range attachment which the Excelsior Gas Stove Company of 34 Foster street, Worcester, Mass., are putting on the market. This attachment is really a hot plate in the form of a shelf and designed to occupy the place on a coal range that is generally occupied by the warming shelf. The hot plate is supported by two brackets attached to its outer edge and which run down and rest on the base of the stove. When it is not in use it can serve the same purpose as the warming shelf. The two tubes shown as extending from the back of the cut are the ends of the generator coil used for heating water when connected with a kitchen boiler. This generator coil is made of brass, and the same flame with which the cooking is done can be used for heating the water; or, this coil can be furnished with a special gas burner to increase the water heating capacity. The

Gas Attachment for Coal Ranges.

company issue a 16-page catalogue showing their water heater and coal range attachment, besides other specialties.

The Baltimore Stove Industry.

In a recent issue of the Baltimore *Sun* appeared a most interesting review of the stove situation in that city, in the shape of a communication from the B. C. Bibb Stove Company. The matter has in it so much of general interest that we reproduce it, as follows:

In common with the varied industries of the city of Baltimore the stove manufacturers have shared in the general prosperity of the country. Not for years have they run their foundries so steadily or given employment to so many men as during the year just closed, and the output, both in quantity and variety, has been correspondingly large.

The manufacturer, the jobber and the retailer have alike been benefited by the increased demand for heating and cooking apparatus of all kinds. Furnaces, ranges, cooking and heating stove of all sizes and styles have been in unusual demand, and wood air tight stoves, whose life it was supposed would be short, still maintain their popularity, and instead of the demand becoming less it seems to be growing.

Although pig iron, which enters so largely into the cost of manufacturing stoves, has declined to a certain extent from the high prices of several years ago, the cost of making stoves has not materially lessened, as other materials have advanced in price; consequently the manufacturer has not been able to materially reduce his prices from what they have been for several years past.

Baltimore manufacturers naturally look to the South as their best customer, and it is there that the bulk of the product of her foundries is marketed, yet no inconsiderable portion is sent in other directions.

Competition in the stove trade is as sharp as it is in that of most other lines of goods, and Baltimore manufacturers and dealers have for their strongest competitors the producers of these goods located directly in the South, while some of the larger manufacturers of the West also send their goods to that market. Still Baltimore need not fear, so long as her manufacturers offer first-class goods at fair prices and hold to fair and upright dealing, that she will not continue to control the bulk of the stove trade of the South, as she has in the past.

As for the year 1902, we have every reason to believe that the stove trade will be fully up to that just passed, with possibly somewhat higher prices.

ODD PLATES.

The Avondale Stove & Foundry Company of Avondale, Ala., have decided to build a Stove and Hollow Ware plant on Ninth avenue, Birmingham, Ala., where they have recently bought a large tract of land.

United States Consul John H. Grout, at Valletta, Malta, reports to the State Department that a change in the regulations regarding the storage of gasoline in Malta is likely to open up a field for the introduction of Gasoline Lamps and Stoves in that island. Up to within a few months the import of gasoline into Malta had been prohibited. Recently, however, it was decided by the Government to admit it and permit its storage both for sale and for private consumption under certain restrictions. Consul Grout believes that a market for American Gasoline Stoves is likely to result.

We have received from the Eclipse Stove Company, Mansfield, Ohio, a series of colored folders containing their Christmas and New Year greeting to the trade, together with an announcement, in verse, of what the trade may expect in the field of Eclipse Stoves and Ranges in 1902. On the outside flap are the words: "Watch the Eclipse in 1902," together with the company's Eclipse trade-mark. A feature of these folders is that they bear the portraits of the salesman who will cover the territory to which the particular greeting is sent. There are eight different folders in the series.

The contract for the erection of the new building of the Simpson Stove & Mfg. Company, Canonsburg, Pa., has been awarded, and active work on it will be begun just as soon as the weather will permit.

The Phillips & Clark Stove Company, Geneva, N. Y., closed their works on December 24 for the annual inventory and repairs. It is thought that the improvements will require about six weeks to complete.

The Stove plant of Spence, Baggs & Co., Martin's Ferry, Ohio, shut down last month for a period of two weeks, in order to take the annual inventory and make such repairs as might be necessary. We understand that 1901 was a banner year with the company, and that they are still behind in their orders.

It is announced that the McClary Mfg. Company of London, Ontario, have recently secured control of the Stove works of the Copp Company at Hamilton. Colonel Gartshore, of the first-named company, intimated, in an interview with the representative of a local paper, that the works would probably be operated for some time at least, if not permanently.

The Faultless Mfg. Company of Chicago, Ill., is the name of a concern recently incorporated with a capital stock of $10,000. The incorporators are Oscar Millsap, Claus Krabel and W. D. Elmer. The new company will manufacture Stoves and Ranges.

The Gold Coin Stove Company of Troy, N. Y., recently rented the premises at the corner of Hoosic street and Fifth avenue, formerly known as the Eddy Foundry, which they expect to occupy very soon. Some alterations will be made to the interior in order to meet the requirements of the Stove company.

Visitors to the showrooms of A. L. Canfield, 284 Pearl street, New York, not only see a handsome line of Beaver Stoves and Ranges, made by the Danville Stove & Mfg. Company of Danville, Pa., and a fine line of Gas,

Gasoline and Oil Stoves, but are also presented with a very dainty calendar for 1902.

The agents in charge of the various branches of the Reading Stove Works, Reading, Pa., gathered at the main office of the company on January 3 for the purpose of having what they designate as a "shop talk." The reports made by the branch managers were of a highly encouraging nature, and we understand it was decided at this conference to make a number of extensive improvements to the plant in Reading. The year's business of the company is said to have been more satisfactory than any in their history. On the evening of January 4 the agents were tendered a banquet by the company at the Mansion House, Reading.

The Syracuse Stove Works, Syracuse, N. Y., have recently rented for storage purposes the property of J. H. McDowell, formerly used by the Syracuse Wall Paper Company. The Stove company had been renting outside storage for some time, but the building named being nearer and more convenient for their use, they canceled the existing lease in favor of the McDowell property. We understand that the new arrangement gives the company a great increase of storage room, which they can utilize to good advantage.

The Chelsea Stove Company, Chelsea, Mich., held a meeting in the latter part of December, when they declared a semiannual dividend of 4 per cent. The affairs of the concern were shown to be in excellent condition, and the business to be rapidly growing.

The Baldwin & Graham Stove Company, New Castle, Pa., are about resuming operations at their plant, which has been idle for the purpose of making the annual inventory and repairs.

An attractive little folder is being sent out by Mahood & Co., 14 North Second street, Philadelphia. The folder is printed on gray paper, with dark blue and silver lettering, and contains a greeting for 1902, together with the statement that the firm are handling the latest improvements, the most handsome designs and the most popular kind of quick selling goods in their line. They say that their salesmen will call upon the trade soon after January 2 to explain the merits of their goods, which include Blue Flame Oil Stoves, White Flame Oil Stoves, Gasoline Stoves, Ovens for Gasoline and Oil Stoves and Ranges of all styles.

Bergstrom Bros. & Co., Neenah, Wis., manufacturers of Royal Stoves and Ranges, are favoring the trade with an exceptionally fine wall calendar. This calendar consists of a large brass bound card to which are attached leaves of good size bearing the necessary details for each month. The figures are large and plain, enabling them to be easily read at a long distance. The back of the calendar is printed in scarlet and gold, making a handsome setting for the monthly leaves.

Edward R. Janes died at his residence, 253 West 107th street, New York, on Wednesday, January 8, aged 73 years. As a boy he started in business, joining his father's firm of Janes, Fowler, Beebe & Co., manufacturers of stoves, ranges and furnaces and iron founders. The business is now continued by his sons, Henry E. and Herbert Janes, under the name of Janes & Kirtland, at 725 Sixth avenue, New York. The firm furnished much of the iron work in the dome of the United States Capitol Building at Washington, D. C. Mr. Janes is survived by his wife, four sons and two daughters.

Mullin Wayne, who formerly represented the Cinderella line of Stoves and Ranges for the Pittsburgh Stove & Range Company, has resigned to accept a position with the Prizer-Painter Stove & Heater Company. Mr. Wayne will be located at their Pittsburgh office, which will be opened in the near future under the management of Charles W. Goodnough.

C. W. Reals advises us that the report published last week to the effect that he had severed his connection with the Keeley Stove Company is erroneous. Mr. Reals has been with the company named for three years, is still with them, and expects to remain with them as their representative in Ohio, Michigan and the city of Chicago.

Letters From the Trade.

Receipts for Remittances.

The following communication from a concern in New Hampshire mentions some objections to the practice of discontinuing sending receipts for remittances as the matter is seen from our correspondent's standpoint:

We have noticed articles in *The Metal Worker* on the subject of manufacturers and jobbers not sending receipts for remittances in payment of invoices, looking upon the indorsed check sent as receipt enough. How does that work when payments are made with bank drafts, which, of course, go back to the bank? There is great effort made now to have all payments in that manner, many refusing to take private checks.

It seems to us that it is very much better to have a receipt. We pay, as is universal now, by sending statement on remittance blank with items, often two or three, and deducting cash discount and any overcharges or shortages. That blank we want back receipted, as we often want to look back for some reason to the statement. If the merchant has no receipt and the cashier's check is in the bank he is badly off.

We also want to know at the time whether parties have received the remittance and not have to wait to find out until perhaps two months or so afterward, when they send statement with notice of draft or a request for payment. The proposed way would work to the advantage of large manufacturers or jobbers to save expense, but we don't think their customers would like it. We should not.

Plural of Tailors' Goose.

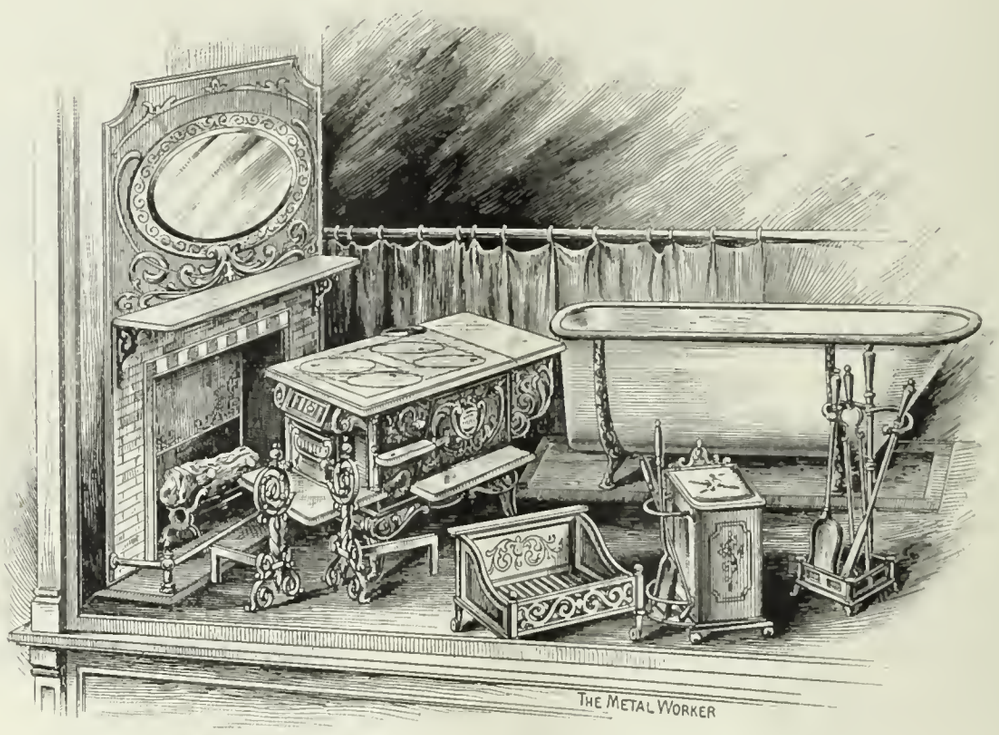
The following inquiry relating to a matter which has perplexed some hardware merchants and has been the subject of facetious treatment is referred to our readers:

We are offering a chance on a set of sad irons to any person who will give us the correct wording of an order for six tailors' goose, or geese, or the plural of goose. Wish you would give us the proper wording and oblige, that we may give the prize to the right party.

Pricing Stock in Plain Figures

A correspondent who is connected with a store in one of the Connecticut cities writes:

I have read the article on show window display by J. C. Sarchet and would like to take exception to some of his ideas on this subject. I do not think that a large variety of goods in a show window is as effective as a small variety and a lot of it. I find that it pays me to mark my goods in plain figures as to the selling price, as when so doing the general public places more confidence in me.



Another point: I had an extra clerk here before the holidays, and in the midst of one of my busiest evenings he was taken sick. What did I do but ask a bright friend to help me out. As my goods were marked plainly he stepped right in and sold goods as well as an experienced clerk. What would I have done if my goods were all marked with private marks?

S. W. Smith, successor to Stoutenberg Mfg. Company, Keithsburg, Ill., issues a folder relating to the Cannon Oiler. This Oiler is formed from an ordinary Oil Can with force pump attachment and long spout. A slight pressure of the plunger permits a drop only to escape from the spout, while greater pressure will produce any amount desired, or throw a stream. This feature is referred to as specially serviceable in the use of thick and sluggish oil, as it can be easily forced out. The Oiler may be held in an inverted position without the loss of a drop of oil, and overhead machinery may be oiled without tilting the Oiler.

Murray & Co. have succeeded Murray & Hall in the Hardware, Stove and Farm Implement business at Winters, Texas. The new firm have enlarged the store, thus materially improving their facilities.

WINDOW DISPLAY OF FINE GOODS.

The sale of the best grade and most profitable goods can be promoted in any locality by displaying them in a show window so as to present a sufficiently striking appearance to attract attention and yet securing the pleasing effect contributed by good taste in the selection and arrangement of the articles exhibited. A particularly good example of this method of trade building is shown in the accompanying sketch of a show window in Norwalk, Conn. The window is a very wide one, there being but one in the front of the store. It is not partitioned off from the rest of the store, but is separated simply by a low rail, from which is hung a plush curtain which makes a good background for the display. In the window, on the side away from the door, stands an oak mantelpiece and fire place, in which is a gas log. This appeals to the eye of many people. Then the range and the bathtub attract attention. In front of these are andirons, a grate and fire sets. The whole arrangement and display is a bit unusual, and is calculated to appeal to the best class of trade.

Window Display of Fine Goods.

Stove and Hardware Dealers.

The interests of the Lisk Mfg. Company and the McLaughlin-Martin-Parkhurst Company, both of Canandaigua, N. Y., are to be consolidated under the former style. The Lisk Company were organized 12 years ago and manufacture Antirust Tinware. The McLaughlin-Martin-Parkhurst Company were formed during the past year for the purpose of manufacturing Enameled Ware. The leading stockholders in each company are interested in the other, so that the matter of consolidation will not be a difficult one.

Bewley Hardware Company, jobbers and retailers of Hardware, Agricultural Implements, Stoves, &c., Chester S. C., have applied for charter with privilege of increasing capital stock from $10,000 to $25,000.

A. A. Rumreich has succeeded the firm of F. P. Rumreich & Son in the Hardware, Stove and Sporting Goods business in Pisek, N. D. The store room has been materially increased in size and a tin shop added, 22 x 14 feet in dimensions.

James G. Geagan, who was for 16 years with Clancy Bros., Syracuse, N. Y., and for 13 years was their sole representative on the road, has secured an interest in the Drennan-Briggs Hardware Company, 325-327 West Fayette street, of that city, the name of which was changed to the Drennan Hardware Company January 1. Mr. Geagan will act as general manager. In addition to the line of Iron, Steel, Heavy Hardware, Galvanized Iron and Tin Plate now carried by the firm, they will put in a complete line of Wagon Wood Work and Carriage Makers' Supplies.

William Bauer and Henry Schluckebier have dissolved their partnership in the wholesale and retail Hardware, Agricultural Implement, Stove and Wagon and Buggy business in Petaluma, Cal., and it will hereafter be continued by Mr. Schluckebier under his own name.

Thos. Naylor, having disposed of his business at Boyne City, has bought the general store of D. Mills, Gladwin, Mich., and is carrying a line comprising Hardware, Stoves, Bicycles, Tinware, furniture, groceries, dry goods, &c.

Beginning at 10 o'clock on Tuesday and Wednesday mornings, January 14 and 15, E. Bissell & Co., wholesale auctioneers, will conduct a trade sale of 10,000 to 12,000 cases of Enameled Ware seconds. The sale will be held at 12 Murray street and 15 Park place by order of the National Enameling & Stamping Company, and Lalance & Grosjean Mfg. Company. The assortment to be sold will be very large and staple, and will consist of Blue and White, Venetian White and White Regal, Pearl Agate, Peerless and Gray Steel Enameled Ware seconds.

The Olympia Hardware Company of Olympia, Wash., recently had a drawing for a Steel Range, which was secured by Miss Louise Pittman, a young lady who is employed as stenographer at the office of the West Side mill in that city. The committee having charge of the drawing consisted of Mrs. Charles Turner, Mrs. Charles O'Neil and Mrs. Ione Smith.

The Lalance & Grosjean Mfg. Company, New York, have placed an order in Philadelphia for a complete galvanizing outfit for their factory at Woodhaven, L. I. The plant will be used for the manufacture of Galvanized Ware, a line that the company have not heretofore produced. The new plant will be ready for operation in about six weeks' time.

The great power plant for the Louisiana Purchase Exposition, St. Louis, Mo., which is to be the largest in existence, having a capacity of more than 30,000 horsepower, will probably use Texas oil for fuel. The director of works of the exposition is investigating the feasibility of using oil instead of soft coal. If he finds that the expense of the oil is not prohibitive it will be adopted.

TOMMY ENGAGES IN THE HARDWARE BUSINESS.

BY H. F. BELL.

Me an' Uncle William has gone into business together. We're pardners. He said so. Pa wanted to know if I was goin' to be a silent partner when I told him our plans. Silent means still. I don't want to be that kind. Seems too much like home. I felt kinder worried 'bout it. I asked Uncle William if that was the sort he 'tended me for to be. He said, "'Course not. I wouldn't have no partner that couldn't jump over a broomstick or help me whistle 'Yankee Doodle' whenever 'twas 'propriate." I can do both them things.

Uncle William's nice. 'Most as nice as pa. He's brother to pa. So pa's brother to him, an' they each of 'em together got gran'ma for their mother. I don't know as it could been 'ranged that way anyhow, but I'd like to been little when pa was, an' Uncle William, an' had gran'ma to bring us up all 'long of each other. Wouldn't we had just jolly times though! Gran'ma don't 'spect a boy to be a man 'fore he gets over bein' a boy.

I 'magine we're goin' to have some fun now, in business, I mean. Pa ain't in it, 'cept to advise an' cheer us up when we come to meals. An' if we get right to a place where we don't know whether we'll be glad or sorry 'bout what we're goin' to do next, pa's splendid to tell us. He told us one thing to remember in hardware business, or any other. "Always in drivin' a bargain 'bout sellin' anything," he said, "be sure to strike while the iron's hot." I didn't have time to ask him who we'd got to strike, or what for, or what we must keep hot flat irons for. Maybe Uncle William will understand. I'm sure if we've got to strike our customers with a flat iron to make 'em buy, an' have it hot, too, it's awful funny business. Funnier than I s'posed 'twas. Maybe I'd ruther be a silent partner after all. But I guess I'll keep in the firm for a while, 'cause Uncle William's a awful peaceable man, an' I don't b'lieve he'd do no such way to make folks buy.

The way me an' Uncle William got this business was this: Mr. Ironsides, the man who don't own the hardware store in our village no more, sold out. 'Taint his'n now. It's our'n, Uncle William's an' mine. He's moved here, Uncle William has. There's a sight to do when you're just beginning to go into business, 'specially when you buy out a man. Uncle William had to 'range the boxes of things all over on the shelves, an' look over all the books, them big books, where they write down into 'em what you sell, an' when you do it an' how much the man paid, or didn't pay. He counted up how many stoves Mr. Ironsides had sold last year, then counted what was left. Oh, it was bad as cleanin' house when ma's at the head. We've both been dreadful busy; Uncle William couldn't hardly find time to eat. I could. I didn't feel the 'sponsibility quite so much as he, I s'pose.

I thought I was goin' to stay out of school with this on my hands, but ma won't let me. She disappointed me. I can't only be in the store after school an' Saturdays. I 'splained to Uncle William how 'twas. He said he'd have to try and get along without me. Maybe that's what "silent partner" means--not bein' there.

Another thing had to be tended to—the sign. Out in front, you know, to let folks understand we was a hardwear store. In cities, pa says, they mix things up a good eel. In stores you can jist step through one of them big ones with them all glass front, an' find anything you want, 'sides lots you don't want. They keep everything, from a paper of pins to a bycicle.

Me an' Uncle William 'cluded we'd set folks a good example an' be more orderly. If we was goin' to have a tin an' hardwear store, why let it be tin an' hardwear, not groceries, nor millinery. We wanted a nice sign. That man who don't own it no more, he had one. It was a teakettle, hung out on a stick, right 'cross the sidewalk. It used to swing back an' fourth awful when the wind blew. One day a accident come out of that teakettle. The wind was blowin' then. I seen it. Mrs. Sampson was goin' along. She is tall an' has dreadful long arms. Sometimes when she swings 'em she makes me think of them long wooden ones at the railroad crossin', when you can't get across till the train of cars gets by. She had a umbrel. She run right 'gainst that teakettle, her umbrel did, an' knocked it off the end of that stick it was hangin' up on. It fell onto her bonnet, an' she an' the teakettle an' the umbrel an' the bonnet all laid on the sidewalk together.

Bein' a woman she screamed. Everybody run to pick her all up, all to once. She give Mr. Ironsides a awful scoldin'. The teakettle wasn't hurt a mite. I guess stickin' on top of her head softened the fall. Mr. Ironsides picked up the teakettle.

"I guess she ain't much hurt," he said. "Some of the paint is rubbed off, but her ears stand out stralght as ever. She's quite old, but she'll last a spell yet. I guess she's worth savin'." Miss Sampson she set up on the walk, an' she told Mr. Ironsides she wanted him to understand she didn't use no paint, an' her ears didn't stand out no worse than his'n, an' he ought to be 'shamed of himself, callin' her old, an' hintin' how much she was worth. She said she was goin' to law 'bout it an' make him pay. Mr. Ironsides looked 'frald. He said: "Madam I wasn't talkin' 'bout you a tall. I was talkin' 'bout this teakettle." The boys all laughed, an' Miss Sampson scowled at us, took up her umbrel and limped off toward home.

Mr. Ironsides hung it right up again, an' there it staid till me an' Uncle William bought it with the rest of the store. We give it to ma then. She heard us talkin' 'bout it one day, an' she said she'd like to have it to keep matches in. Couldn't no mice get 'em then, an' drag 'em 'round an' set the house on fire, she said. I guess its a pretty good thing, too. The house hain't never got a fire sence she took it.

Uncle William asked me what kind of a sign we should have. I told him I thought a good big one with my name an' his'n on it would be all right. He said that would look nice, but he was 'fraid there wouldn't be room for two such long names. He wanted to put somethin' onto it to tell folks what he could do, like mendin' tinwear, makin' pipes (not smokin' pipes) &c., 'sides his name, you see. He asked me if my feelin's would be hurt if in case he was cramped for room he should leave mine off. I told him I s'posed that would do, seein' 'twas all understood that I belonged there. It's just like in 'rithmetic. Sometimes there's a big figger to set down an' one to carry. The big figger you write down an' the one to carry you don't. It's there all the same. Uncle William's the big figger. He sets down, an' I'm the one to carry. I carry coal an' water an' anything anybody else don't want to.

It's a awful bother to be too little for everything. When you ain't only ten years old seems as if there wasn't nothin' hardly you was big enough for, 'less 'tis to chop kindlin's an' fetch in wood, an' pull weeds, an' hunt up spectacles for your grandmother, an' sech chores. They keep a feller dredful busy, but they don't 'mount to nothin'. Anything ma don't want me to do she gen'ly says I'm too small. But when there's a mean, hateful job on hand, an' I feel all kinder tired out 'fore I begin, she says, "Why, I'm s'prized; such a great big strong boy as you are." Uncle William is more carefuller. He talks it over with me an' keeps talkin' till I think just as he does. Then I'm willin' to do anything he mentions.

There's two dry good stores here in town; one big one little. You'd 'most 'magined that big one was a hardware store; they keep so many of one kind of goods, or did, 'fore something happened that did happen when we first got to running. When they saw our windows all fixed up, an' read the printed notices Uncle William sent 'round 'bout the new firm—that's me an' him—they hustled right up an' sent a boy 'round to every house with papers printed onto 'em how cheap they was sellin' carpet tacks an' bread knifes, an' hammers, an' dishpans, an' other hardware things. Uncle William's cousin's step-father has got a dry goods store down in Columbus. He wrote to him to send on a big box full of things an' he'd sell 'em for him. I s'pose Uncle William must have 'splained all the circumstances, 'cause it come—the big box. All sorts of pretty things was in it when we took off the top lid.

Uncle William told me to take the saws an' axes an' oil stoves an' such decorations out of the north wludow; the one Mr. Pennyworth can see plainest from his store. I did. Uncle William took them dry goods things an' fixed 'em all in that wlndow. My, didn't it look pretty! Silk an' lace curtains, an' sofy pillows, an' them pretty little pink an' blue sacks women put on when they comb their hair, an' kids—real ones—gloves, you know, an' lovely shirt waists. Ma snid nobody hadn't never had none like 'em in our town before. We put n big card in the window that said: "All at Cost. A Present to Each Customer." Our store was full all day. When 6 o'clock come there wasn't nothin' left in that window but a ginham apern an' a 5-cent handkerchief. We took them to ma when we went to supper.

Them farmers from the country bought lots of tinware an' nails and things besides. The present Uncle William give 'em all was a new bright tin cup. Them other folks 'cross the way hadn't nothin' to do all day 'cept to watch us. I was glad 'twas Saturday. I was awful tired though when night came. So was Uncle William. "T'was a satisfied tired," he said, when he was countin' the money. I got 25 cents of that money myself. Uncle William said he wouldn't want no partner an' not pay him nothin' I wouldn't want him to, not if I was the partner.

Mr. Pennyworth hain't never said much in public 'bout his hardware stock since me an' Uncle William had our grate sail of dry goods. He come over that next week an' told Uncle William he'd 'bout made up his mind it didn't pay to keep hardware an' dry goods all to once. He wanted us to buy him out. We did. We like each other real well now. We're real sociable since we made up, an' he found we didn't have no more dry goods. We told him when anybody inquired of us for anything we didn't have we'd send 'em over to him. Me an' Uncle William thinks it's better for us all 'round than if it hadn't never happened a tall, 'cause now if a man wants a hammer or a woman a paper of tacks we're sure of that man an' that woman, 'cause the nerest hardware store is 7 miles off, over to Spindleville. We mend tin things, too, that's kinder worn out. Jack, he does it. Me an' Uncle William's 'prietors an' Jack he works for us. He puts some sort of stuff on that covers the old hole all up awful bright an' nice. It looks like a new patch on a boy's old pants.

After we had our dry goods sale folks begun to come in real thick. Our money drawer got so heavy Uncle William said I'd better not try to pull it out no more "'count of danger," he said. I couldn't see no sign that anything would break or anything. But then I s'pose the things you don't think the most about is the very ones that a good many times often happens. Pa always told me, "My son, never ask questions 'bout anything you can find out for yourself." I didn't this time. I was sorry, too, in three ways. Sorry I tried to find out, sorry I did find out, sorry I had to be sorry after I found out. You see I thought, bein' a partner, I might as well know 'bout that money drawer. Maybe I'd have to go there some time when Uncle William wasn't 'round. On business, of course.

One day when he was gone to see 'bout puttin' a furnace in the church I thought 'twonld be a good chance to 'vestigate. I wanted to find out how it worked. I found out. It worked quick. Uncle William always called it the "Hold Fast." I thought he meant 'cause it held the money fast as you drop it in. You can't always tell what the name folks calls a article by means 'till you get 'quainted with it. I feel pretty well 'quainted with this one now. I know it means that when you try to pull the drawer out from under side, an' touch a little iron thing under there, something springs right out an' pinches hold of your hand an' makes you scream, 'cause it won't let go. I found that all out in 'bout three minutes; quicker'n I could learn a spellin' lesson. I couldn't get away. Not 'thout leavin' part of my hand. I 'cluded to stay. Uncle William came. I was cryin'. He unlocked me. I'll have to wear a plaster on my hand for a week ma thinks. That's hard wear, pa says. An' the money drawer didn't come open neither. I feel most sick. It always makes me feel so when so much trouble happens that don't 'mount to nothin'. Pa said he should think I'd know how 'twould feel to be a burglar now. It made me 'most shiver. Uncle William was real good. He said honest people, specially boys, often gets caught if they go too near the traps set for rogues.

There's a awful stingy man lives here in Toppletown. He come into our store one day an' bought two of them little windows what you put into stoves. Mikeys is their name. Pretty soon back he come with one of 'em. He wanted to sell it back to Uncle William. He said he split the other one an' made two of it so didn't need this one. We took it, that Mikey, an' then that man said he should 'spose we might be generous enough to 'low him somethin' on it for washin' it. Uncle William told him he'd 'low him just two minutes to get outside the door onto the sidewalk. He went. We have a grate eel of fun here in our hardware store. I enjoy everything, 'specially some things more than others. I druther keep store than be policeman or theological student.

Defects in Trade Unions.

At a recent meeting of the Central Labor Union at the Labor Lyceum in Cleveland, Ohio, Harry D. Thomas, business agent of the union, gave an unusually interesting and suggestive address on the principles of trades unions and their defects in actual practice, from which we give the following extracts:

The principles of trades unions, he said, were elevating. The reason this was not more generally recognized was because they were compelled to bear the odium of what he called "cheap" and "fake" organizations. It could be laid down as a cardinal point that any trade or craft that was not thought enough of by the men who were employed in it to form an organization that was international in its scope and fortify it with a large fund was hardly worth bothering with.

"To illustrate what I mean," said Mr. Thomas, "I need only mention a meeting I attended to-day, when men employed in a particular line of work attempted to organize a union. The first thing they insisted upon was to make the initiation fee for the charter members as low as possible. Some of them wanted it as low as 50 cents, and when it was pointed out that they would have nothing to fortify themselves with in case of trouble or industrial depression, their answer was that the fee could be raised later. Right there is the great trouble with trades unions.

"The great majority of the people who join them do so not for the purpose of benefiting the general condition of the men who are employed in their trade, but simply to benefit themselves at the expense of those who do not join the union. For instance, 20 per cent. of the members of a certain craft form a union. Then, instead of trying to induce the other 80 per cent. to come in, they raise the fees to keep them out. What is worse yet, they make laws governing apprenticeship and try to prevent boys from entering their trade. In short, their entire purpose is not to benefit the condition of those in their trade, but to simply benefit themselves. They do not take into consideration the fact that if they can prevent boys from learning their trade, those boys will overcrowd some other trade.

"But no union can lay down rules and specify how many boys shall learn the plumbers' trade, or the carpenters' trade, or the moldors' trade. They may do so for a while, but in time things will adjust themselves along natural lines. When the Amalgamated Association of Iron and Steel Workers was at its greatest power some of the members made all the way from $10 to $25 per day. They had restrictive rules and looked with contempt upon the helpers, the rod men, and wire drawers. When they held their conventions and the helpers asked that something be done to improve their condition also, the answer was, 'We are looking out for ourselves and you do likewise.' It never occurred to them that the helpers were men with feelings, until last summer, when these very helpers, who had so long been looked upon with contempt, took their places, with the result that the strike was a total failure. In the long run no craft or clique of men can advance themselves at the expense of their fellow workmen. There will come a day of rockoning and the employers will reap the benefit."

Mr. Thomas referred to the International Society of Carpenters and Joiners and the International Society of Engineers as the best types of trades unions.

"The carpenters and joiners, of which I am a member," he said, "was organized away back in 1856 in England. Our strength lies in the fact that our fund is never allowed to go below $10 per member. It doesn't belong to any particular local or division, but at the order of the Executive Committee will be transferred to wherever it is needed. Some years ago all the money we had in this division was transferred to some of the cities in England and Canada where there was trouble. We didn't feel bankrupt, however, and later, when the depression came on between 1893 and 1896, we received $4 for every dollar we sent away. The organization now has a fund of about $1,500,000, and if the depression keeps up in England a great deal of this will have to be used to help the members who are out of employment.

"Whenever a 'fake' organization is formed a strike is almost sure to follow. Next we see begging expeditions to help the strikers, but they almost always fail.

"Another defect in trades unions is the fact that they do not keep up with the progress made in their own crafts. A revolution has come about in nearly all the trades during the last 20 years by the invention of machinery, and yet the rules and regulations remain the same as they did."

A WATER WHEEL FOR THE WINDOW.

It is well known that moving objects attract more attention to a show window than any other kind of a

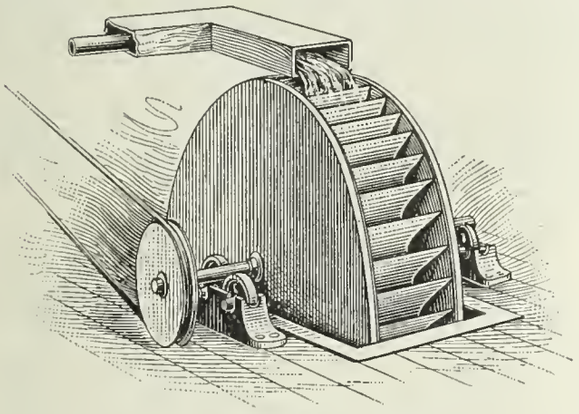


Fig. 1.—The Water Wheel in Position.

display that can be made. Many merchants exert special efforts to attract crowds to their windows just before Christmas, and employ mechanical displays only at that season. Where there is no shafting in the

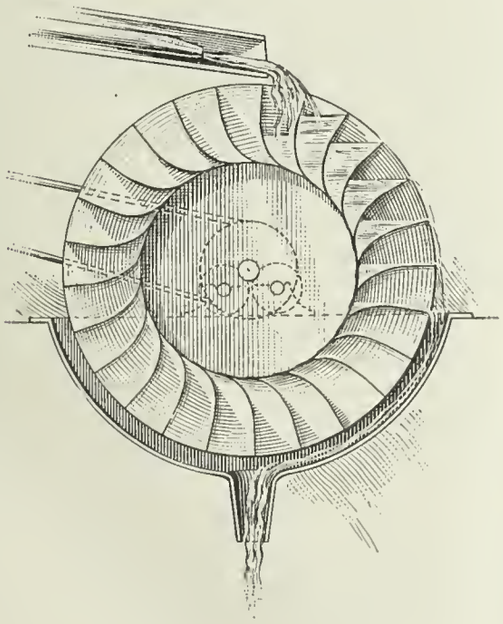

Fig. 2.—Section of the Wheel.

building, power for a mechanical display can be supplied by either electric, spring or water motor. Below is given a description of an overshot water wheel that has been used occasionally for the past few years in the show window of J. M. Page & Co., Naugatuck, Conn., and was made by them in their own shop.

This wheel, as it is in position on the elevated platform that is placed in the window, is shown in Fig. 1. A section of the wheel is illustrated in Fig 2. The sides of the wheel are made of two pieces of galvanized iron cut into circles 24 inches in diameter. Between these, and perpendicular to them, are placed, and securely soldered, 25 pieces of galvanized iron 5 inches wide and

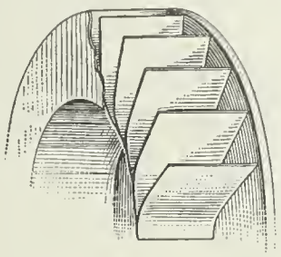

Fig. 3.—Detail of the Buckets.

6 inches long, so that the sides of the wheel will be 5 inches apart. These are arranged to form the buckets and are bent as shown in Fig. 2. It will be noticed that the bottom of each bucket partition is soldered to the bottom of the next one. Arranged in this way the opening of each bucket will be about 3 by 5 inches and the buckets will be about 5½ inches deep. It is essential that they be bent properly so as to hold the water as long as possible and thus secure the maximum efficiency. The construction of the buckets is more clearly shown in Fig. 3. When the galvanized iron wheel is completed, all joints being properly soldered, rigidity is given to it by fastening to each side a circle of 1-inch boards, 24 inches in diameter, as illustrated in Figs. 1 and 3.

As before stated, when this wheel is used in the window an elevated platform is put in to hold the wheel and the display. In this platform a well is cut, as shown in Fig. 1, and in it is placed the galvanized iron

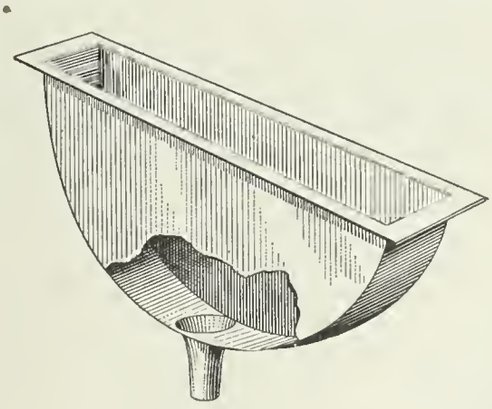

Fig. 4.—The Trough Catching the Water.

trough illustrated in Fig. 4, to catch all the water from the wheel. The outlet from this trough connects with the sewer pipe. The wheel is supported by a shaft made of gas pipe that works on a grindstone bearing that permits it to revolve readily. On the shaft is fixed a 6-inch grooved pulley, on which a belt runs, working the display. The water to run the wheel is supplied through a ⅝-inch lead pipe flattened on the end, so as to give a stream about the size of a lead pencil. This wheel has been used in making several displays, in some of which it is in sight and in others hidden. When in sight the pipe is placed in a wooden box or sluice, as shown in Fig. 1. The water fills the buckets and its weight causes the wheel to revolve slowly. The power obtained is sufficient to move fairly large displays slowly. One of the features of this motor is that when it is once in place and started it requires practically no attention, except turning the water off at night and on again in the morning.

AN INVESTIGATION OF PLUMBING.

An important question has been presented by United States Senator McMillan to the Commissioners of the District of Columbia as to the number and character of unsanitary buildings in the city of Washington, and to the extent to which bad plumbing exists in buildings in the city. The inquiry was suggested by the proposed expenditure of an immense sum of money to provide for the removal of disease germs from the Potomac water. The ground is taken that the end to be attained by this expenditure will be largely nullified if plumbing is allowed to exist which is inimical to the public health. Should the question presented be agitated it will naturally lead to a house to house inspection of plumbing, in which case there is no doubt but that the plumbing which exists in the city of Washington will be found to by no means come up to the standard required for new buildings. Where a house to house inspection, or any approach to it, has been attempted, much opposition has resulted, many property owners not being in a position to go to the expense of throwing away the plumbing system that they have and providing a thoroughly sanitary system.

There can be but little doubt that the whole plumbing trade will favor the step, which is for the public good. It is eminently proper that this important step in sanitary work should begin in the capital city of the nation. Should the investigation be carried out to any considerable extent, the highest law making body will be put in possession of valuable information as to the character of plumbing that exists in an old city and its effect on the general health. The investigation will also provide a correct idea of the opposition which the citizens will present to an examination of their property that is likely to force upon them an unwelcome expense. It is to be hoped that this important subject will be thoroughly investigated. The outcome will be watched with considerable interest by the health boards and the plumbing trade throughout the country.

Presentation of Loving Cup to W. K. Pierce.

One of the most enjoyable social events of the season occurred at Syracuse, N. Y., on January 2, when W. K. Pierce, president of the Pierce, Butler & Pierce Mfg. Company, entertained the officers of the company, the managers of the different departments, the managers of the branch offices and many of the salesmen of the house. Most of the guests arrived on the night trains, so that the morning was spent at the main office in Syracuse renewing acquaintances and exchanging experiences of the year. The guests were provided with lunch at the Grill, and in the afternoon the entire party went to the plant where the Pierce boilers and radiators are made, so that the men might become thoroughly familiar with the process of manufacture and the facilities of their company to take care of their customers, which facilities have been greatly increased during the past year.

The leading feature of the entertainment was the dinner served in the evening in the dining room of the Century Club. Covers were laid for 26 guests. The decorations of the room and the table were pink, with an abundance of cut flowers. The *menu* selected reflected the excellent taste of Mr. Pierce as a host, and the meal was served and enjoyed as it only could be under the genial hospitality which is characteristic of that gentleman. At the close of the dinner, Thomas Wheatley, on behalf of the guests, presented Mr. Pierce with a handsome loving cup. This cup is of Colonial design, perfectly plain, and upon the face bears the inscription: "William Kasson Pierce, 1902, From the Boys." In presenting the token to Mr. Pierce Mr. Wheatley dwelt upon the pleasant relations which had always existed between the employees and the president of the company, and Mr. Pierce gracefully responded in acceptance.

The guests of Mr. Pierce were: William George, C. F. Bennett, Thomas Wheatley, P. M. Beecher, F. W. Fix, Jr., I. H. Frot de Veaux, R. C. Strong, C. A. Mosnor, Frank Kehoe, F. C. Matthews, W. M. Butler, J. J. Herbrecht, E. H. Giles, F. E. Buckingham and H. S. Gardner of this city; E. C. Molby, Frank Barrett, J. K. Simpkins, A. D. Burnett and I. H. Seward of New York; J. J. Bennett, E. A. Morriss and H. B. Secor of Boston, and W. H. Peterson and W. J. Bryan of Philadelphia.

The Crane Company's Profit Sharing Plan.

On the evening of December 31 the Crane Company of Chicago for the third time distributed among their employees a large amount of money as a Christmas gift, in recognition of the services rendered, and with the desire of giving their workers some share over and above their wages in the splendid prosperity that has come to the company in the year just closed.

Every person in the employ of the company, 3500 men and women in all, received a sum equivalent to 5 per cent. of the money each has earned in 1901. No limit was put on length of service; men only a month at work got 5 per cent. of that month's wages. Fifty clerks worked for two weeks figuring out these percentages, and late in the afternoon the pay wagons were sent out to the different branches of the company at Judd and Twelfth streets, Jefferson and Van Buren, Jefferson and Randolph and Fulton and Desplaines.

For several days it had been rumored about the various plants that the company intended to take some action of this character, but nothing was definitely known among the great body of workmen till the whistles blew at 6 o'clock, giving the signal for the close of the last moment of work in the old year. The men were stopped as they were about to leave for home, and were told to file in to the paymasters' offices, where each received his handsome gift with its accompanying holiday wish. The average value of the Christmas box was $36, though many drew a great deal more than that.

At every one of the plants, for an hour after the close of work, hundreds of men stood about the gates and talked of the generosity of the company. The amount thus disbursed was about $125,000.

A Brass Goods Catalogue.

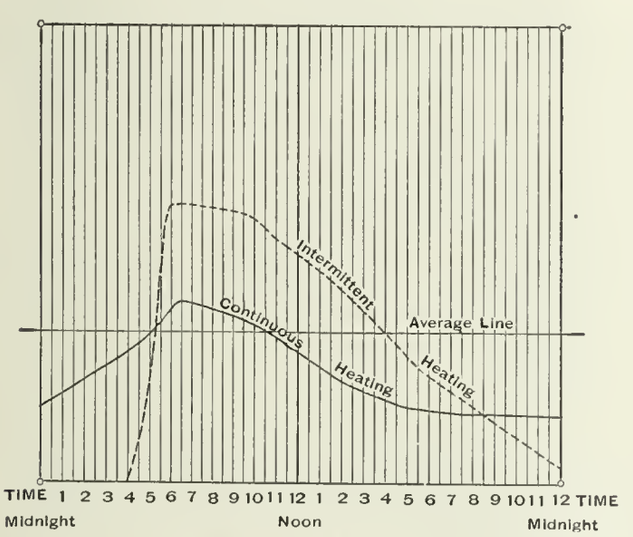
Through the courtesy of Charles S. Hirschfeld, 82 Chambers street, manager of the New York office of Landers, Frary & Clark, New Britain, Conn., we have received a copy of their new catalogue of plumbers' brass goods for 1902. The catalogue consists of some 50 pages, the introduction stating that all the company's goods are made of the best material, that special attention is taken in grinding the ground key work to an exact fit, and that the finished goods are subject to a test of 150 pounds pressure. The company's compression faucet bibs and bath cocks are made with a square edge instead of a V-shaped thread, which, with the close fit and slightly hollowed seat, gives them an increased durability. Special attention is called to their Simplex stop and waste cocks, which can be made right or left hand without difficulty, and used with lever or T handle or hydrant rod. The first section of the catalogue shows a variety of brass liquor cocks with different styles of handles and with keys made with threads for screwing into casks, smooth so that they can be driven and also for soldering. Several different styles of compression cocks for use in connection with oil cans, water coolers and similar goods are shown. These are made to be secured by means of a flange and lock nut, and also to solder. In addition to a variety of styles of compression, plain and hose bibs for iron and lead pipe are some with flange and thimble. Compression stop and waste cocks for iron and lead pipe are also shown, together with wash tray bibs of different styles. The catalogue also includes a variety of basin cocks of the compression and self closing type. These are followed by double compression bath cocks and the Simplex stop and waste cocks, rough and finished, for iron and lead pipe, made in all the various styles necessary for plumbing work. The last page shows hose nozzles, lawn sprinklers and towel racks.

Sullivan & Ryan, Carbondale, Pa., have the contract to install the plumbing and heating systems in the Roberts Building, at Peckville.

Central Station Hot Water Heating.*

BY CHIEF ENGINEER ALBERT TICHELMANN OF DRESDEN.

Translated from the German by Charles F. Hauss.



I submit to you here what is an open question, and one which will probably be brought much nearer its solution by being laid before you for discussion. When I speak of central station heating, I have in mind a plant which from the central point should supply warmth to points within a radius of 3000 to 6500 feet. For quite a number of years I have given much thought to this subject; at the beginning, of course, only theoretically.

In view of the fact that we have news from America of practical success in this direction, an open discussion of the question here, taking into consideration the present state of the science, would be of service and in order, for, as far as I know, a practical solution of the problem has thus far not been seen in Germany.

For the heating of either a single building or a series of buildings, the first question is, naturally, whether the heat is to be supplied by a new boiler, or if the source of heat is at hand which can be used without a great increase of cost.

If the heat is to be supplied by the erection of a new plant, high pressure steam heating has been always used by us in Germany. This method of heating has been in use for quite a number of years, and in many cases with the greatest success and satisfaction, even in cases of most complicated sets of buildings. It is a matter for the future to decide if this method of heating should, in certain cases, be replaced by a central station system of hot water heating or not.

If boilers are at hand, as is often the case in factories or in electric central stations with condensing engines, we have heretofore used only the high pressure steam in conveying the heat to distant points. In electric lighting stations the use of the necessary boilers for heating purposes has an especial interest, for the reason that the use of the power for heating and lighting comes at different times of the day, as indicated in the following diagrams shown in Figs. 1 and 2, illustrating the power used at different hours of January 15, 1901 (which was an average day), in a lighting station in Dresden, Germany.

Central Station Hot Water Heating.—Fig. 1.—Chart Showing the Demands Made on the Plant at Different Hours of the Day.

I add that the curve (power) shown in Fig. 2 remains the same all through the year. The diagrams show how much less of the power is needed for lighting purposes during the morning hours as compared with the evening hours, which goes to show that much of this power could be used in the morning with advantage for heating purposes.

In view of the fact that the attendance in the boiler room is generally the same, even though the surplus steam be used during the morning hours for heating purposes, it stands to reason that the use of the boilers of a central lighting station as a source of heat is practical for heating buildings.

This order of thought prompted the erection of the central station system of steam heating mentioned in the paper read by Professor Rietchel. In this system the lighting system, as well as the very complicated heating system, is supplied from a single boiler room. I add that, in this case, the use of steam was logical, for the reason that several of the separate buildings had steam heating systems installed, which were only connected to the central system. Considerations of economy would commend this system over any system of separate boilers.

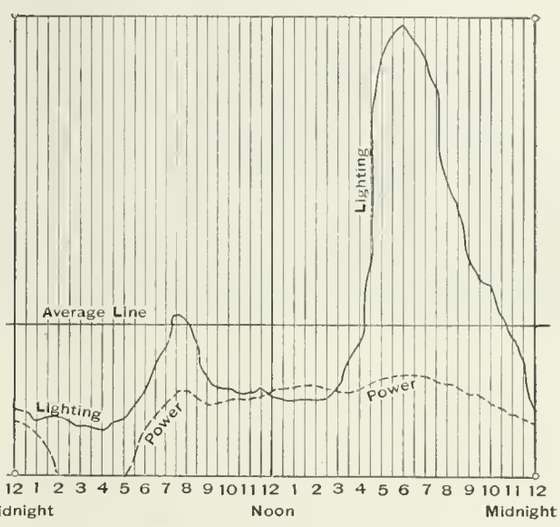


Fig. 2.—Chart Showing the Demands Made on the Plant for Lighting and Power at Different Hours of the Day.

The use in America lately of methods for using the exhaust heat from condensing engines is a matter of much interest and one that I will bring up later.

If we assume that we have a series of buildings, such as hospital or administration buildings, to heat with hot water from a distant central station, the question arises, Is it really practical to first make the high pressure steam to carry this to the separate buildings and there transform the same into hot water, or would it seem more practical to make the hot water in the central station, and deliver it at once, in this form, to the several buildings, it being assumed that the water can be delivered at its destination at the proper temperature? The loss of temperature in both steam and water systems is about the same, as will be shown later.

One advantage in the use of central station hot water heating is the simpler type of boilers, &c., than would be necessary for high pressure steam, which is naturally followed by a simpler method of operation and a total absence of the several converters * at the different buildings, as well as of the losses occasioned by their systems of piping and the natural loss due to the transformation of steam into water. In addition to this is the advantage that the heating of the separate buildings is simplified.

The hot water heating system can naturally be used for supplying hot water for domestic purposes, and the same claims made for a central heating plant can be advanced for a central warm water supply plant over isolated plants. I might mention that City Building Inspector Schmidt of Dresden has designed and is erecting a central hot water supply plant for the new hospital in Dresden, which, when finished, will afford a good comparison with the smaller separate systems.

To return to the matter of hot water heating; it may be well to mention the advantage of being able to reduce the losses in temperature in the piping system by being able to run the apparatus at a lower temperature in mild weather. In high pressure heating we can also reduce the pressure and consequent losses by radiation

* Read at the third meeting of the Society of German Heating and Ventilating Trades, August 13, 1901, at Mannheim, Germany.

* A converter is a hot water boiler in which the water is heated by the high pressure steam instead of coal.

In milder weather, but not to the same extent as in hot water heating, as the areas are figured at the outset for as low a temperature as possible.

The possibilities of central station hot water heating are readily seen when the following points are technically realized: It is necessary that the water can be forced from the central plant to the point of use and back again by a pump without the temperature of the water interfering with the proper action of the pump. Let us assume that the highest temperature of the flow pipe is 195 degrees F., and the return pipe temperature at radiators is 140 degrees F., and if the pump is connected to the return system, the return water will enter the pump at, say, 136 degrees F., and at a pressure of 22 to 37 pounds with a hight of building of from 40 to 80 feet above the cellar floor. There can be no question as to the reliable action of the pump under these conditions.

A second important thought arises with the question whether the proper end temperature can be secured without too great a velocity in the system and a too large demand on the pump. The expense of operating a pump only need be taken into consideration when it is necessary to operate it with gas or electricity. But if a small steam boiler is at hand, as is the case in hospitals,

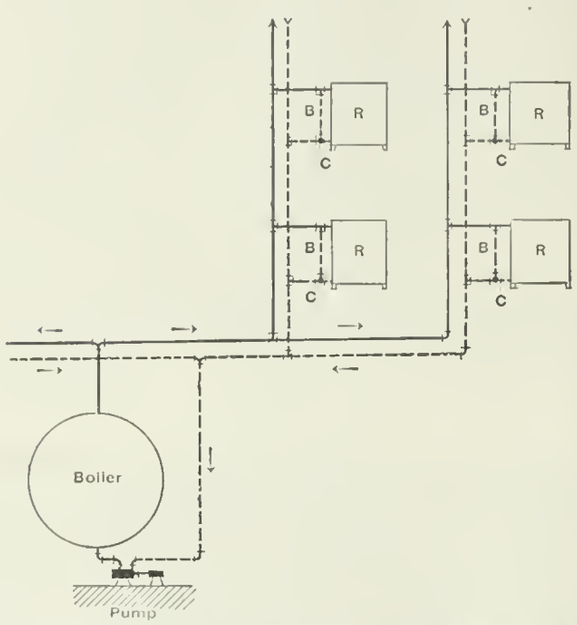

Fig. 3.—Piping of Central Station System, Showing Radiators, By Passes, Three-Way Cocks at Radiators, and Flow and Return Mains.

&c., for cooking, laundry or disinfecting purposes, which is always in use, the power for the steam pump can be gotton from this source, and the exhaust steam from the pump utilized in helping to warm the water. Hence the cost of operating the pump is very slight.

I will now illustrate to you how to make a central hot water plant independent of the number of radiators that may be in use at any time by a simple arrangement of the pipe system. A system of this kind is shown in Fig. 3. The pipe system is the same as is used for ordinary gravity hot water heating, with a rising main system of piping and cellar distribution. By connecting the flow and return connection with a by-pass, *b*, and having at point *c* a three-way cock, the amount of hot water to pass through the radiator can be regulated; yet the flow of water through the pipes remains the same. Hence, if the temperature of the water at the boiler rises it can be seen at once that some of the radiators are cut off, and, if the automatic regulation be good, the fire would at once be checked.

I call your attention to the fact that a three-way cock regulates in the exact proportion that it is open or shut, which is not the case with other valves, which give a less accurate regulation.

The regulation of the temperature with this system is therefore the best.

The following examples will illustrate how the pump work. Areas of main pipes and losses in temperature are dependent on the flow pipes.

Take, for instance, a central station which should supply 12,000,000 B. T. U., which should be divided equally between three points, each 1300 feet apart, a total of 3900 feet. The flow temperature at the end of this stretch should be 195 degrees F., and the return water temperature 140 degrees F. Hence we require $\frac{12{,}000{,}000}{55}$ = 220,000 pounds of warm water per hour with a temperature slightly above 195 degrees to be delivered into the system, and a velocity of about 4 feet per second; the following sizes of pipe are necessary:

The first stretch with 4,000,000 B. T. U., a main pipe 4 inches diameter.*

The second stretch with 8,000,000 B. T. U., a main pipe 5½ inches diameter.

The third stretch with 12,000,000 B. T. U., a main pipe 6½ inches diameter.

In the January, 1901, issue of *Mittheilungen aus der Praxis des Dampfkessel und Dampfmaschinen betriebes* is an article in which the central station hot water heating system of the Toledo Heating & Lighting Company of Toledo, Ohio, is described. In this article the losses are shown due to friction of hot water in a 1-inch pipe. These figures give such a smooth list for all except water at 212 degrees that I am prompted to accept the figures as being correct and the tests as accurate. The coefficients of friction are here shown to be somewhat less for hot water than those established by Weisbach for cold water. Applying these American coefficients to the above mentioned work, the entire line of 3900 feet would offer resistance equal to, say, 95 feet of water column, or, say, 43 pounds pressure, which, in view of the great distance the water is carried, is very small. To overcome this pressure a pump of 14 horse-power is needed, and if we assume the building to be 80 feet high, then the suction end of the pump is under a pressure of 37 pounds and the discharge end of 79 pounds.

Now, to figure the losses in temperature of the three lines of flow pipes: Assuming that the pipes are insulated with good covering, the coefficient of transmission being 5.7, we have the following losses:

	Degrees F.
For the first line	0.5
For the second line	0.7
For the third line	0.8
Total	2.0

Hence the water at the boilers must be delivered into the mains 2 degrees higher than it is wanted at the end.

If we wish to increase the system by two further extensions of 4,000,000 B. T. U. each, 1300 feet further from the central plant, making the total of 6500 feet of travel, and assuming the same velocity of 4 feet per second, the dimensions of the pipes would be:

For the first stretch of 4,000,000 B. T. U., a pipe of 4 inches diameter.†

For the second stretch of 8,000,000 B. T. U., a pipe of 5½ inches diameter.

For the third stretch of 12,000,000 B. T. U., a pipe of 6¾ inches diameter.

For the fourth stretch of 16,000,000 B. T. U., a pipe of 7¾ inches diameter.

For the fifth stretch of 20,000,000 B. T. U., a pipe of 8¾ inches diameter.

The frictional resistance would equal 130 feet of water column, and requires a 30 horse-power pump, which, with a building hight of 80 feet, would put a pressure of 37 pounds on the suction and 97 pounds on the discharge end of the pump.

The losses in temperature would be as follows:

	Degrees F.
The first stretch	0.51
The second stretch	0.72
The third stretch	0.80
The fourth stretch	0.97
The fifth stretch	1.08
Total	4.08

Hence the water as it enters the mains at the boiler must be at 198½ degrees F., if it is to reach the end of the main at 194 degrees. It may be well to remark at this point that it is possible to reduce these losses by incasing the flow main in a box containing poor conduct-

* The sizes 5½ and 6½ inches are regular stock sizes of pipe in Europe.

† In America, of course, it would be necessary to use commercial sizes of pipe, which in this case would be 4, 6, 7, 8 and 9 inches, respectively.

ing material; in which event the flow being surrounded by a comparatively warm atmosphere, the end temperature should be practically the same as at the beginning.

Now to compare a high pressure steam system with the above mentioned hot water system: If we assumo the distances and amounts of heat required to be the same, the size of steam and return pipes will be as follows:

The first stretch: steam pipe, 6¾ inches diameter; return pipe, 3½ inches diameter.
The second stretch: steam pipe, 6 inches diameter; return pipe, 3 inches diameter.
The third stretch: steam pipe, 5¼ inches diameter; return pipe, 2¾ inches diameter.
The fourth stretch: steam pipe, 4½ inches diameter; return pipe, 2½ inches diameter.
The fifth stretch: steam pipe, 4 inches diameter; return pipe, 2 inches diameter.

If we assume that the average temperature of the steam is 284 degrees, and the return water temperature is 176 degrees, and the flow temperature of the water in the hot water heating system is 194 degrees and return 140 degrees, both having equally good covering on the pipes, then the losses of temperature in the high pressure steam system are to the losses in the water system as 10 is to 9. Then we must not forget that, in

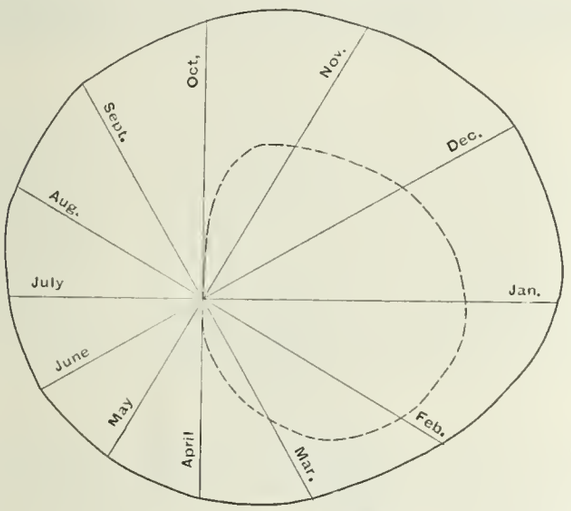

Fig. 4.—Outer Line Shows Comparative Amount of Fuel Used Each Month, and Inner Dotted Line Shows Comparative Amount of Heat Furnished.

milder weather, the difference in favor of the hot water system in this respect is very much greater.

I now will refer to a case where a single large building is to be heated with mechanical circulation. This calls for boilers, and a pump driven by electricity, the whole system to supply 8,000,000 B. T. U. The distributer in the boiler room has as its most difficult circuit one that is 650 feet long, which must supply 1,600,000 B. T. U. In this circuit the first branch is 360 feet distant, and supplies 160,000 B. T. U. There are in all ten such branches or points of distribution, spaced equally 32½ feet apart. In view of the fact that the motive power for the pump is electricity and comparatively expensive, it would be well not to assume too great a velocity in the mains; hence let us assume the moderate velocity of 3½ feet per second, and we get the following diameters of pipe necessary:

For the first stretch with 160,000 B. T. U., a pipe 7⅛ inches diameter.
For the second stretch with 320,000 B. T. U., a pipe 1¼ inches diameter.
For the third stretch with 480,000 B. T. U., a pipe 1½ inches diameter.
For the fourth stretch with 640,000 B. T. U., a pipe 1¾ inches diameter.
For the fifth stretch with 800,000 B. T. U., a pipe 2 inches diameter.
For the sixth stretch with 960,000 B. T. U., a pipe 2⅛ inches diameter.
For the seventh stretch with 1,120,000 B. T. U., a pipe 2¼ inches diameter.
For the eighth stretch with 1,280,000 B. T. U., a pipe 2½ inches diameter.
For the ninth stretch with 1,440,000 B. T. U., a pipe 2⅝ inches diameter.
For the tenth stretch with 1,600,000 B. T. U., a pipe 2¾ inches diameter.

The frictional resistance is equal to 25 feet of water column, and requires a pump with electro motor of only 2½ horse-power. For the riser pipes and radiator connections the velocity should be reduced to 1½ feet per second so as to avoid hammering or gurgling noises. With this velocity the following sizes of pipe are necessary:

Up to 20,000 B. T. U., ⅜-inch pipe is necessary
Up to 32,000 B. T. U., ½-inch pipe is necessary.
Up to 64,000 B. T. U., ¾-inch pipe is necessary.
Up to 120,000 B. T. U., 1-inch pipe is necessary.
Up to 180,000 B. T. U., 1¼-inch pipe is necessary.
Up to 240,000 B. T. U., 1½-inch pipe is necessary.
Up to 440,000 B. T. U., 2-inch pipe is necessary.

From this we can see that the sizes of pipes are very small, and that the first cost of pump and motor can be greatly offset by the lower cost of piping. Another, and greater, advantage is that the piping can in all cases be laid against or in the ceilings, as there is no necessity for a pitch in the piping. If we now add to these advantages the fact that radiators can be set on a level with, and almost any distance below, the boiler, and that the attention necessary is much less than in high pressure steam, the mechanical circulating hot water heating apparatus should commend itself for use in all administration buildings, &c.

I now turn to the question, To what extent can central station hot water heating be used to reclaim the heat lost in the larger steam plants? The arrangements for using much of the exhaust steam from engines are made in many approved forms. If the exhaust steam from an ordinary engine is to be used for hot water heating an ample water heater in which the water can circulate, but where condensing engines are used, as is generally the case now, surface condensers are best. As the temperature of the waste hot water increases the amount of vacuum in the condenser decreases, which naturally increases the fuel consumption of the engine.

To decide whether it would be better to choose a simple exhaust engine and use this exhaust steam for hot water heating purposes, or to use a condensing engine and heat with direct steam, or if it be better to use a condensing engine with only a partial vacuum at times, depends entirely on the time that the heating is to be done and when the greatest amount of work is to be done by the engine. Hence each case must be examined and figured separately.

To illustrate the approximate amount of fuel necessary I offer the following: An exhausting engine requires about 1.25 times the amount of fuel required by a condensing engine. Hence, if we take the amount of fuel used by a condensing engine per month = 1, then the amount of fuel used in n months = n 1, and that of the exhaust engine as 1.25 n, of the fuel heat necessary for an exhaust engine 80 per cent. can be used for heating purposes. Consequently 0.8 n = n of the fuel heat used. Whereby we would assume that the heating work being done is always the maximum. Inasmuch as the amount of heat necessary varies with each day, it is well to figure the average, which would be two-thirds of the maximum. Consequently the fuel necessary for a year would be $12 \times 1.25 = 15$, of which practically two-thirds is available for heating purposes. Now, if heating is necessary only six months of the year, and the amount of fuel used during the year is the same, then $2/3 \times 6 = 4$ of the entire fuel necessary, 15, or 26 per cent. of the fuel annually used is available for heating purposes. With a condensing engine of the same size used throughout the year and contemplating direct steam heating, the fuel necessary would be $12.1 + 2/3\ n$.

If, for instance, we figure on six months' heating, the cost of fuel would be $12 \times 1 + 2/3 \times 6 = 16$, as against 15 for the exhaust engine.

Now take the condensing engine used $12 - n$ months and the heating being done with a partial loss of vacuum, then the fuel necessary therefore is $(12 - n)\ 1 + 1.25\ n$, when we drop the necessary vacuum, or $12 + 0.25\ n$.

This goes to show that the plant with a condensing engine and direct steam heating, as compared with a condensing engine and using the condensed steam, is as $\frac{12 + 2/3\ n}{12 + 0.25\ n}$, which goes to show that the plant using a con-

densing engine and direct heating increases in expense as the heating season is lengthened, and in a six months' heating period the proportion is as 16 to 13.5. If we take into consideration that the condensing engine runs during the heating period with a partial, though small, vacuum and under better conditions than were assumed herein, it naturally increases its advantage when the waste steam is used for heating.

The largest plants in which the exhaust can be used to advantage are our electric lighting plants. An American, in an article in the *Street Railway Journal*, shows that the foresight of a prophet is not necessary to see how the heating and lighting of our cities is to be done in the future. According to him, the solution of the problem lies in the use of hot water that is sent from a central station over an area with a radius of 1½ miles to the advantage of the projectors and the satisfaction of the consumer. The credit for the first solution of this problem belongs to the Heating & Lighting Company of Toledo, who have supplied the city with heat and light during the past five years. This time is too long to consider it in the light of an experiment; it must be accepted as a commercial success.

At the time the central electrical station system was being introduced the demand for heat and light was about equal. In this new system electricity is becoming more and more a side product, as of the high pressure steam, which is necessary to drive the engines, only a small percentage of the heat is used, and 80 per cent. of the surplus heat is used in heating the city from the central station. Should an inventor offer to make electricity without cost he would certainly create a sensation. Yet this is what the Toledo Heating & Lighting Company have done, for during the six months ended January 1, 1901, the report shows that they heated 199 houses and lighted 450 houses. This is followed by a table showing an efficiency of 90 per cent., which seems to me an optimistic report, as I will show.

In the circular diagram, Fig. 4, is shown a monthly comparative amount of fuel used, and inside the same, in dotted lines, the amount of power used for heating purposes. The radiant lines show the months. These curves are both drawn to the same scale, and show that the amount of fuel necessary in summer for lighting is comparatively small, and that the requirements for light increase in about the same proportion as for heat. If we assume that under the best conditions in which a condensing engine can be used in connection with heating the fuel consumption cannot drop below 12, but must naturally rise, and inasmuch as during a six months' run the fuel consumption of a plant with condensing engine and direct steam heating = 16, therefore the saving of fuel in a plant using the waste heat from the condenser is $\frac{16-12}{16} \times 100 = 25$ per cent. Therefore, there can be no thought of the furnishing of electricity becoming a side product in electrical central stations.

Referring to Figs. 1 and 2, it will be seen that to prevent losses of vacuum, &c., through the condenser it would be necessary to store electrical energy during the day for night use and heat at night for use in the morning. The fact that losses will occur in the storage of electrical and heating energy would indicate that the 25 per cent. saving mentioned above would be very nearly wiped out. The attention necessary to properly handle the storage of heat and light would also add to the cost. Hence I do not believe that I am too pessimistic when I say that the use of condenser heat is hardly justifiable, and that I cannot understand how the operation of the Toledo plant can be so economical.

As soon as there is a demand for hot water heat only there will be found a way for utilizing this heat, or at least a part of it, by sending the return water through the condensers in the morning to raise the temperature as high as possible; then, with fire or live steam heaters, raise it to its proper light. The advantage in doing this is to not increase too much the cost of operating the engine.

Naturally there is some economy in using the waste heat, and this could be greatly increased if, say, during the summer it could be used for warming water for public baths and for domestic use. To bring this question to a proper solution, I would recommend to the trade to compare hereafter this hot water central heating system with any contemplated high pressure steam heating plants in the hope of using it and getting some reliable data.

It is my thought that conditions in America are different to what they are here; hence I warn our industries to be careful in following American ideas too quickly lest our industry be injured by it.

NOTE.—The discussion was very spirited both for and against, but all agreed that central station hot water heating is a subject worth all the time that can be applied to it.

New York City Notes.

The Bronx Branch of the Master Plumbers' Association of New York is rapidly increasing in membership and has been very successful so far in giving its members protection where needed. Its membership is now over 40. Secretary McEvily was a visitor at the meeting of Manhattan Branch last Tuesday evening.

* * *

The next meeting of the Greater New York Association will be held in Long Island City on Monday, January 13. All members of Queens Branch should keep in touch with what is done at this meeting.

* * *

Owing to the diversion of the different city departments under the boroughs by the new City Charter, it has been decided that plumbers' bonds must be taken out in the borough where the plumber is working, not from the Sewer Department, which is abolished, but from the office of the borough president. This may entail additional expense, but it will save a lot of time consumed by outlying plumbers having to come to Manhattan, and it should also keep the local officials in closer touch with the work going on.

* * *

No change has yet been made in the Examining Board of Plumbers. John Renehan, the president, is the only one whose term expires. The appointing power, the Mayor, will have to go a long way to find three more conscientious and painstaking examiners than the present board. They have been very busy for the past six weeks with the large number of applicants who have presented themselves for examination.

* * *

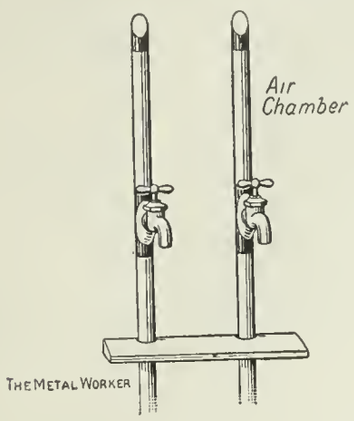
Among the busy plumbers not heretofore mentioned is John W. Cooney of 355 West Twenty-sixth street, who was the successful bidder for the new Macy department store on the block on the west side of Broadway, from Thirty-fourth to Thirty-fifth streets, of which the Fuller Construction Company are the builders. He is also busy with a 15-story apartment house at Madison avenue and Sixty-third street, and an office building at John street and Broadway, for the same builders. Besides the above mentioned work, Mr. Cooney has two private houses on Fifty-fifth and Fifty-sixth streets, near Fifth avenue.

* * *

The numerous friends of Henry J. Pattison, ex-national secretary under President John Mitchell, will be pleased to learn that he has secured a fine position as cashier to County Clerk Hamilton.

* * *

Among the other plumbers who have secured positions under the new administration is Michael Hecht of 697 East 155th street, who has been appointed Deputy Superintendent of Public Buildings by President Haffen of Bronx borough.



* * *

Spelman & Co. are reported to have been the successful bidders on the new Astor apartment house, at Fifth avenue and Fifty-fifth street. As before mentioned, this will be one of the finest apartments in the city. The principal piping, fire lines, waste, vent, &c., are to be of brass, with the other materials corresponding.

SUPPLY PIPE AIR CHAMBERS.

BY HELMAR.

Faucets on plumbing systems supplied with water under a high pressure should be provided with air chambers to prevent the shock of "water hammer" and the attending destructive effect not only on the faucets, but on the pipes. Valves and some forms of compression faucets which necessarily close slowly do very well under low pressures without air chambers in cases when the waterway is small, the connection direct and the supply pipe relatively large, because under such conditions the velocity of the water in the supply is low and it is checked gradually. Reaction is greater as the pressure and velocity increase, and is the result of checking water in motion, and is caused by the water being practically incompressible.

Supply Pipe Air Chambers.—Fig. 1.—Air Chambers at Sink.

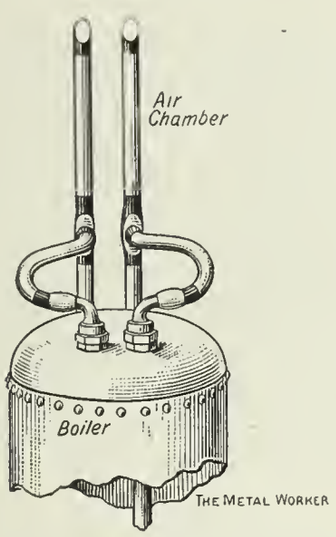


Fig. 2.—Air Chambers on Boiler Service Pipes.

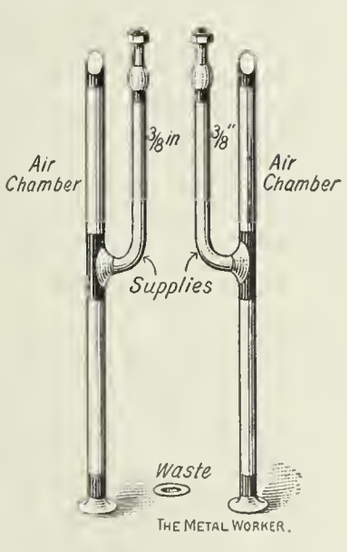

Fig. 3.—Air Chambers on Lavatory Supply.

In ordinary plumbing work air chambers should always be put in, because the pressure may be changed or different kinds of faucets substituted when those first put in are worn out. The ordinary chamber, shown in Fig. 1, is merely a continuation of the pipe into which the faucet is branched and ought to be at least 12 inches long, because the amount of air contained is small to begin with and some of it is absorbed by the water, leaving barely enough to cushion the motion of the water on fair pressure when one is placed over every faucet and made as long as good appearance or conditions will permit. They should always be placed as direct as possible, and those at the faucets may be supplemented by others placed over the boiler, at least 12 inches long, as shown in Fig. 2, and elsewhere as the design of the job suggests or permits.

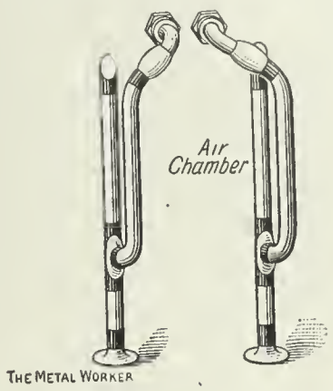

Fig. 4.—Air Chambers on Bath Supply.

On lavatory and bath supplies the coupling piece should always be branched into the supply proper and the supply continue straight up for the chamber, as shown in Figs. 3 and 4.

Where simple supplies continue from the sink to bath or other fixtures above, bulb air chambers, as shown in Fig. 5, are sometimes made by wiping on a piece of 2-inch pipe above the faucet and letting the bathroom supply pipe extend downward inside of it from the upper end to near the bottom. The bathroom stop and waste cocks should always be placed above these chambers.

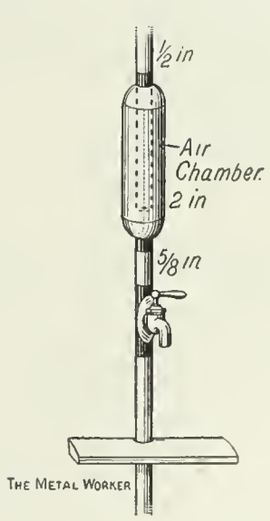

Fig. 5.—A Bulb Air Chamber.

JAMES BOWMAN died at his home, 1402 Sheffield street, Allegheny, Pa., on December 27 after an illness of two weeks, aged 53 years. Mr. Bowman was born in Allegheny, and a number of years ago entered the new plumbing firm of Bridge & Bowman. On its dissolution Mr. Bowman continued the business alone. He was an official member of the Union Methodist Church and a prominent Mason and Odd Fellow. He is survived by his wife and one sister.

ASSOCIATION NEWS.

Northwestern Association of Master Plumbers.

A call has been issued by President F. R. Dengel of the Wisconsin State Association of Master Plumbers for the annual meeting, which is to be held in Milwaukee on January 14 and 15. It is said that over 700 invitations have been issued to plumbers in the five principal States which constitute the Northwestern Association, to meet in Milwaukee at the close of the Wisconsin State Convention, on January 16, 17 and 18. The principal discussion at the State gathering, it is understood, will be on the question of the agreement with the manufacturers in regard to the sale of plumbing material. The Northwestern Association consists of members from the States of Wisconsin, Iowa, Illinois, Minnesota and Montana,and has been in existence about five years. In view of the fact that no agreement now exists between the plumbers and the manufacturers, this meeting in the city of Milwaukee, the home of Charles Polacheck, the vice-president of the National Association of Master Plumbers, may have special significance, inasmuch as E. D. Hornbrook, president of the National Association of Master Plumbers, has recently issued an official list of the membership of his association.

Pittsburgh Master Plumbers.

The annual meeting of the Master Plumbers' Association of Pittsburgh and vicinity was held on January 8, and the following officers elected for the ensuing year:

President, S. S. White.
Vice-President, C. S. Craig.
Treasurer, Frank McKnight.
Secretary, George Sands.
Sergeant-at-Arms, M. Purtill.
Executive Committee: John M. Addy, M. Counahan, W. N. Sauer and Max Snively.

Cincinnati Master Plumbers.

The annual meeting of the Master Plumbers' Association of Cincinnati, Ohio, was held on January 2, when the following officers were elected for the ensuing year:

President, J. B. Lauman.
Vice-President, M. J. Cash.
Secretary, Robert Kieserling.
Treasurer, William Donohue.
Directors: Charles Naunce, John Story and W. F. Wayne.
Sergeant-at-Arms, Thomas Lynn.

After the election a dinner was served at the Victor Café, Thomas Canary acting as toastmaster and performing his duties in a happy manner.

Those present were: Julius Hengstenberg, J. B. Lauman, William Donohue, William Wagner, Joseph Lawson, M. J. Cash, T. Lynn, Clifford T. Schlemner, Ray J. Hillenbrandt, Thomas Canary, Richard Murphy, John Simon, William Attlesey, Charles Botley, William Warner, Louis Kronse, George Kieswetter, Frank Noonan and Henry Niemes.

Brooklyn Master Plumbers.

The annual meeting of the Brooklyn branch of the Master Plumbers' Association of New York City was held on January 3 with a large attendance of the members. The reports of the various officers showed the association to be in a flourishing condition. After the transaction of the regular business the election of officers was taken up and the following were elected for the ensuing year:

President, Dennis Donegan.
Vice-President, William M. Brown.
Financial Secretary, Charles Schwenker.
Recording Secretary, Samuel Corcoran.
Treasurer, Louis Gfroerer.
Sergeant-at Arms, John Moyles.
Marshal, Herbert Wilkes.
Trustees: George W. Smyth, E. S. Kelly and William Biermann.

Montreal Master Plumbers.

The Master Plumbers' Association of Montreal, Canada, held their annual meeting recently in the rooms of the Liberal Contractors' Club, in that city. The attendance was large. The annual reports were read, followed by the election of officers. The following were elected for 1902:

Honorary President, John Date.
President, Thomas Moll.
First Vice-President, Thomas O'Connell.
Second Vice-President, Joseph Thibault.
Third Vice-President, W. G. Graham.
Secretary, J. A. Gordon.
Financial Secretary, J. C. Brunet.
Treasurer, Captain Giroux.
English Corresponding Secretary, J. W. Hughes.
French Corresponding Secretary, Alderman Joseph Lamarche.
Chairmen of Committees: Sanitary, P. C. Ogilvie; Auditing, J. A. Watson; Apprenticeship, P. J. Carroll.

Australasian Master Plumbers.

At the annual meeting of the Master Plumbers' Association of Otago, New Zealand, held October 18, considerable interest was evinced in the reports, which showed the association to be in a flourishing condition. The following officers were elected: John Scott, president; H. A. Ross and A. Burt, Jr., vice-presidents; T. Walker, treasurer, and T. Christie, H. Renfree and R. Scott, Executive Committee. The newly elected president has also been appointed to a seat on the Drainage and Sewerage Board of Dunedin, New Zealand. The association agreed to make it a rule that apprentices must attend the technical school classes until they qualify themselves to pass the city and guild examinations of London.

At the annual meeting of the Master Plumbers' Association of Victoria the following officers were elected: J. K. Johnston, president; M. A. Horne, vice-president; Charles Shuell, secretary; J. Alexander, financial secretary; J. Wood, treasurer. In addition to the above named, F. B. Brady, W. Walsh, W. Cash, George Fountain and William McKerow form the Executive Committee.

The P. & S. S. League.

The bowling games in the Plumbing and Steam Supply League tournament were resumed on Monday night at the Monarch alleys in New York. The Salesmen team are forging to the front, having taken the H. P. Read Lead Works and the Ronalds & Johnson Company, New York, teams into camp with the good scores of 728 and 796. The Read team lost both their games. The feature of the bowling on Thursday night was the scoring of their first winning game by the E. F. Keating team. Of course it had to come some time, and as a result the Thomas G. Knight team lost two games, for the invincible family team of Behrer & Co. won both their games, which put them even with the leaders in the tournament—the team of the John Simmons Company—both having won 8 and lost 2 games.

The business heretofore known as Fleck Brothers, dealers in Plumbing, Gas and Steam Goods, with chief office and store at 44 North Fifth street, and branch store and warehouse at 1641-1645 American street, Philadelphia, Pa., and of which the officers were H. H. Fleck, president, and George C. J. Fleck, secretary and treasurer, was on January 2 dissolved, and succeeded by Fleck Brothers Company, Incorporated, who will, in the future, conduct the business as heretofore at 46 to 50 North Fifth street, Philadelphia, Pa. There will be no change in the policy or management of the new company.

The contract for plumbing the new Court House at Rhinebeck, N. Y., has been awarded to Bannon & Co., Rondout, N. Y., at their bid of $9492.

THE INFLUENCE OF OUTER WALLS ON RADIATION RULES.

BY A. TEE.

Everything that I have ever seen in print designed to assist those who must decide the amount of radiation necessary for a building I have read with a great deal of care. The rules presented in *The Metal Worker* recently for greenhouse work compare favorably with those I use and have proved in practice. However, it is for residence heating particularly that rules are most needed. In many respects the custom of the tailor measuring a man for a suit of clothes could be followed with advantage by the heating contractor. The tailor not only measures his man to get his size, but also examines him to find whether he is full or hollow chested, whether the suit will have to be padded a bit to fill out and keep him warm, and whether he wants his coat to button well up in front, or whether he is going to wear it open all the time.

Some time since a man sent a plan of his house in the country to a contractor to know what it would cost to heat it. The plans with dimensions were all the contractor had to guide him, and he figured liberally, in his opinion. Then, as the work to be done was at a considerable distance and he was busy, he advised that the work be given to some local contractor, if one could be found to take it.

EXPERIENCE EXPANDED THE RULE.

Such a man was consulted. This man had been in the heating business many years and was familiar with the character of buildings in his locality, and after seeing the building agreed to do the work at the price that had been named, but would not guarantee the work. This brought the customer back to the original contractor, who also had had a wide experience. The statement that the man who had been on the spot and seen the building would not guarantee the heating of it with the liberal apparatus which he had laid out led the original contractor to question the owner as to the character of the building, when it was found that it was an old building, lathed and plastered on the inside, and with thin weather boarding on the outside nailed directly to the studding. Immediately the original contractor saw his error, and he at once told the customer that the rule he followed in such a case would be to multiply the amount of radiation that he had previously considered necessary by two, and to provide a boiler capable of supplying an increased amount of radiation, the price being advanced in proportion. The plant installed on these lines proved satisfactory.

THE VALUE OF A RULE.

This brings up the point that any rule for figuring radiation is valuable in proportion to the judgment that is used in applying it. For the man who is taking up heating as a new branch of his business the best rules that he can get are only guides, but after he has had experience their value is increased. A rule is only made to be strictly adhered to by those who have not the knowledge of the business which will enable them to depart from it when it is necessary. Almost all rules for calculating radiation are intended for application on buildings so constructed that they will retain the heat that is provided within them. An ordinary 9-inch brick wall which is stripped so as to leave an inch or so of air space between the wall and the lath and plaster is the type of a wall generally considered. Walls of that kind will not retain heat much better than frame constructions which have their studding covered with good sheathing to which building paper is fastened before the weather boarding to make the finish is nailed on.

WALL CONSTRUCTION GOVERNS THE RADIATION NECESSARY.

In some instances little attention is paid to the character of the sheathing. Shaky, warped lumber full of season cracks and knot holes, with crooked edges, is often applied, no care being taken to make it fit close together, and to cover the building up tight. As little care is taken in the selection of the building paper and in applying it. In consequence when thin weather boards are used and they warp or spring a little, there is nothing to hinder the air going under the boards and paper through the sheathing until the cold air comes directly in contact with the thin coat of lath and plaster. Such a house is almost as hard to heat as if no sheathing was used, and it will require a great deal more radiation in it than a house of the same size that is carefully built. Those who do heating work cannot pay too much attention to finding out the character of the construction of the buildings which they are called upon to heat, particularly if they are old buildings or of cheap construction. They will save themselves many complaints and much trouble if they point out to the owner that such buildings will not retain heat and apparatus that furnishes a larger amount of heat must be provided when they figure on work. After they have learned the character of the building they will do well to provide liberally, both as to the boiler and the amount of radiation for heating the house.

THE PROVISIONS OF A GOOD RULE DOUBLED.

An instance of this character comes to mind, where an engineer laid out a system of heating, with a boiler supposed to have a sufficient capacity and with ample radiation. This proved insufficient, and after two years a size larger boiler was used without overcoming the difficulty. Finally, the owner came back to the engineer and in conversation it was found that the old building had no sheathing under the weather boards, which were old, cracked and somewhat loose. The engineer asked the question why that information had not been given to him in the first place. The plant was remodeled with a boiler double the original capacity and twice as much radiation, after which the owner expressed himself as perfectly satisfied with the service secured.

If the heating contractor will be careful to learn something of the building which he has to heat before he attempts to heat it, he will have less complaint as to the value of rules and better success from his work. Advantage will attend the practice of applying any rule to the room that common sense will decide is the easiest to heat and increasing the provisions of the rule in proportion to the difficulty that will be discovered in the rooms that will naturally need more heat. All rules increase in value with the knowledge of the conditions surrounding the result to be accomplished and the care with which the rule is applied to meet them. Examine the building, study the rule, then apply common sense. If your price is too high explain to your customer. If he won't listen, let the other fellow have the job and watch the result.

Heating and Plumbing Notes.

The Brooklyn branch of the Association of Master Plumbers of the city of New York has appointed George W. Smyth, M. F. Gleason, H. M. Noble, William M. Brown, J. A. H. Ebel, E. S. Kelly, W. J. Piercy, Jr., and Edward Macdonald as the committee in charge of the annual entertainment and reception, which will be held at Schwaben Hall, corner of Knickerbocker and Myrtle avenues, on Tuesday, January 21. The committee have favored *The Metal Worker* with tickets for the entertainment, which they say will not only duplicate past successes, but improve upon them. The invitation which the committee are sending out contains a special invitation to the ladies. The letter also gives the various street car lines by which the hall can be reached.

The Rhode Island Supply & Engineering Company are doing the piping in the boiler and engine house of the new plant of the Eastern Bolt & Nut Company, at East Providence, R. I.

C. F. Young, formerly in the Philadelphia office of the United States Heater Company, has been transferred to their new York office to assist the manager, W. S. Newkirk.

A fire visited the plumbing establishment of J. W. Bennett, at Haddonfield, N. J., on December 28.

F. E. McCormack & Co of Lestershire, Pa., have the contract for the plumbing and heating plant for the new Opera House, at New Milford, Pa.

R. G. Parsons, secretary of the Board of Public Works of Buffalo, N. Y., will receive bids until January 9 for the heating and ventilating system in the new Lafayette High School Building in that city.

The Climax Acetylene Gas Machine forms the subject of an illustrated folder that is being distributed by the New Process Mfg. Company, Dallas, Texas. A feature of the circular is a lengthy list of names of satisfied users of this machine. The company are prepared to make estimates on piping and fixtures for acetylene gas for any class of buildings.

The Universal Sanitary Supply Company of Newcastle, Pa., are about to double the capacity of their plant. There are now four kilns at the plant, and it is the intention of the company to have eight kilns in operation as soon as they can be completed. The company now employ 125 men making Sanitary Earthen Ware.

The Examining Board of Plumbers of Utica, N. Y., organized on January 2, with John P. Shaughnessy as chairman; John Broz, treasurer; James F. Cahill, chairman of Finance Committee, and T. W. Fogarty, clerk.

Robert Scott of Philadelphia has the contract to install a $10,000 steam heating apparatus in the new printing house of Stephen Greene in that city. He also has the contract for heating St. Vincent's Home.

Edward Mahl, Hartford, Conn., has the plumbing contract and Libby & Blinn the heating contract for the addition to the Moseley Building in that city.

The contract for plumbing the new Auditorium which is being erected on College street, New Haven, for Yale University, which will amount to $6000 or $7000, has been awarded to Thomas W. Corbett. The heating will be done by the Walworth Construction & Supply Company of Boston, Mass.

An engraved card received from Boston, Mass., bears the inscription, "The Gurney Heater Mfg. Company Extend the Compliments of the Season. Boston, January 1, 1902." This card has been sent to those who handle Steam and Hot Water Heating Apparatus throughout the country.

The Southington, Conn., Water Company are making arrangements for extending their water mains to Milldale, which will require about a mile of 6-inch pipe and involve an expense of about $4500.

The C. J. McCurrin Company, 432 Tenth street, N. W., Washington, D. C., dealers in Plumbers,' Gas and Steam Supplies, are sending out a large wall calendar for 1902 with the monthly sheets 24 x 36 inches in size and the numbers 2¼ inches high. The space above the calendar bears the address of the company and calls attention to the character of goods which they handle.

W. B. Arnold & Co. of Waterville, Maine, have been awarded the contract for heating the new City Hall at that place, their bid being $2700, which was the lowest of five. The Carman-Thompson Company of Lewiston bid $2048 and secured the contract for the plumbing work.

The ordinance of 1892 requiring the plumbers of Chicago to pay a license fee having been declared unconstitutional by the Supreme Court last June, has resulted in the bringing of 400 suits against the city to recover fees paid. Three hundred cases have been tried and judgments secured aggregating $20,000. The judgments range from $40 to $150.

P. C. Antonides, Albany, N. Y., has moved his plumbing shop from River street to the Richtmyer Building on Reed street.

The plumbing trade will congratulate John Campbell of Paterson, N. J., on the honors conferred on him by the Paterson Caledonians on his retirement as Chief of Clan. He has been at the head of his clan at gatherings in various cities in the United States and at Glasgow last year, as well as at numerous Highland games. His portrait in costume is highly prized by many friends of Scotch extraction.

William L. Whipple, Providence, R. I., who has been seriously ill for several months, is again at the plumbing shop, at 47 and 49 Manton avenue. He reports business to be fairly good, and as the large mills in the section of the city in which he is located are running full time, he confidently looks for a brisk spring trade.

The National Association of Master Steam and Hot Water Fitters announce that manufacturers and dealers on their "list in accord" are extended the privilege of furnishing their catalogues to be kept on file at the National headquarters of the association, 260 West Broadway, New York City.

Frank G. Du Bois, a certified public accountant, has opened an office at 100 Broadway, New York City, in addition to his office, 102 Heller Parkway, Newark, N. J. Mr. Du Bois is well known to the plumbing and heating trade, both wholesale and retail, and is prepared to assist in putting their books in order at this season, when settlements are being made.

W. H. Zech, Reedsburg, Wis., reports a good year in the plumbing and heating business. A year ago he purchased the business from John G. Schuster, who has since been conducting a similar business in Denver, Col.

R. C. Bartley & Co., Bartley, N. J., manufacturers of the Favorite Heater, expect to enter their new building on May 1. It was actually finished two months ago, but delay is caused by the dam from which power will be derived not being ready. The new works will have more than three times the capacity of the old, the latter being altogether inadequate to meet increasing business.

J. P. Rundle of the Rundle-Spence Mfg. Company of Milwaukee, Wis., retired from the company on January 1, selling his interest to William Spence, who has assumed entire charge of the business and will continue to manufacture a varied line of Plumbing Goods.

Ward McLean of Brooklyn, N. Y., died at Walters Park, Warnersville, Pa., on Monday, January 6. He had been unwell and went to Warnersville for the benefit of his health. Mr. McLean was 81 years of age and was born in New York City. He was connected with the McLean Engineering Company, steam and electrical contractors and constructors, of New York. He is survived by his wife and three sons.

Michael Dore died at his home, on Third street, Waterford, N. Y., December 29, at the age of 54 years. About 15 years ago he embarked in the plumbing and housefurnishing business on Fourth street, where he remained until the time of his death. He was a member of St. Mary's Church and of the Knights of Columbus. Mr. Dore is survived by his wife, two daughters and one son.

The W. B. Hubbard & Son Company have been incorporated at Boston, Mass., with a capital of $65,000, to do a Plumbing Supply business. The directors of the company are William B. Hubbard, Frank W. Hubbard and Wallace R. Hubbard.

The new law regulating the plumbing business in Seattle, Wash., went into effect on January 1. All plumbers carrying on business must now pass an examination and secure a license. The local Board of Plumbing Examiners consists of Dr. Gibson, who is president of the Seattle Board of Health; James McIntyre, City Plumbing Inspector; James Stock and John Manoway, master plumbers, and Robert Simpson, Journeyman plumber. The fine for doing plumbing work without a license is $50.

James H. E. Greene died at his home in Worcester, Mass., on January 2, after an illness of several months. He was 54 years of age and conducted a plumbing business at 343 Pleasant street. Mr. Greene is survived by his family and his brother, John H. Greene, who is engaged in the plumbing business at 20 Lincoln square.

F. A. Warburton of Port Gibson informs us that he has opened a branch of his plumbing and tinning business at Fayette, Miss., where a new water works system and an electric lighting plant are now being constructed.

Charles Van Stone, for many years with the Walworth Mfg. Company, of Boston, resigned his position and intends to embark in the manufacturing business for himself in the near future. He has already secured facilities at L and First streets, Boston.

In the District Court at Austin, Texas, on January

7, several members of the Master Plumbers' Association of Texas pleaded guilty to violating the anti-trust law and confessed judgment to the sum of $1400 for penalties. The cases against 33 other members who were parties to the original suits were dismissed for the lack of evidence.

New Firms and Changes.

The Detroit Separator Company have been incorporated at Detroit, Mich., with a capital stock of $15,000, by James C. McGregor, James E. Foley, David E. Austin, A. M. Kerr and Hugh Brodie, to manufacture and sell Steam and Water Appliances.

R. V. Edel has resigned his position with the United States Heater Company, and has opened an office at 62 Broad street, New York City, where he will make a specialty of designing heating plants and making plans of heating systems for architects, builders and steam fitters, and preparing specifications for installing the work. Mr. Edel has been with the United States Heater Company for a number of years and designed the heating system for the City Hall, Birmingham, Ala.; for St. Austin's School, at Salisbury, Conn.; the Hamilton Building, Hackensack, and the Franklin Building at Rutherford, N. J., besides those for many private residences, churches, halls, and all kinds of buildings.

The Hawkeye Heating & Plumbing Company of Des Moines, Iowa, have been incorporated with a paid in capital of $6000 by T. J. Shea, C. J. Salin and Fred. Jackson. The company will install heating and plumbing systems, and manufacture Heaters and Plumbing Supplies.

The Union Plumbing Company have been incorporated at Atlanta, Ga., by Charles Whitefoord Smith of De Kalb County; Charles M. Roberts, John Woodside and G. N. Kellogg of Fulton County; A. I. McPherson of Jefferson County, Ky., and H. F. Thompson of Hamilton County, Ohio.

The firm of James & Gates, 156 Fifth avenue, New York, representatives of the Novelty Iron Works of Canton, Ohio, have been dissolved by the withdrawal of H. T. Gates. I. G. James will continue the business and look after the interests of "Our Own" line of Steam and Hot Water Heaters in New York and vicinity.

The firm of Miller & Johnston, Fall River, Mass., have been dissolved, Nathan Miller, the senior member of the firm, retiring after an association in the business of 15 years. Mr. Miller has secured quarters at 155 Pocasset street, where he will conduct a steam and gas fitting business.

The New Century Heating & Appliance Company have been incorporated under the laws of New Jersey, by Thomas L. Jones, W. K. Burton and T. W. Beach, all of Memphis, Tenn., with a capital of $1,000,000, to manufacture Heating Apparatus.

J. W. Roberts, founder and largest stockholder of the Parkersburg Supply & Plumbing Company, Parkersburg, W. Va., has disposed of his controlling interest in that concern to one of his former partners, R. C. Smoot, and T. W. Starbuck. Mr. Roberts retires to give his attention to more important interests. Mr. Smoot has for several years been manager of the business, and his ability in this line is well known. Mr. Starbuck has had invaluable experience in the same business here and with large concerns in New York City. Under the control of these two experienced men the large and prosperous business of the plumbing company will undoubtedly maintain the reputation attained in the past.

The Carnegie Steel Company have posted notices at their Duquesne Steel Works forbidding interference with employees because of religious or political beliefs, and stating that employees will be discharged for failure to pay their bills. Some of the rules posted are as follows: "1. No interference shall be permitted with the civil, religious or political opinions of any employee, and no political notices shall be posted in the works. 5. Any employee who is arrested for a criminal offense and leaves his position vacant thereby will be discharged. 6. Any employee who habitually neglects and refuses to pay his bills will be subject to discharge. 8. All superintendents and foremen must pay strict attention to the rights and privileges of the employees, and whenever a vacancy occurs the employee of long service and in the line of promotion must be selected, regardless of his political or religious belief, providing he is able to fill the higher position." The other rules are relative to the care of machinery and the conduct of employees. Rule seven states that the use of intoxicating liquors while on duty is forbidden and renders the user liable to discharge.

The Polytechnic Association of the American Institute.

The Polytechnic Association, a section of the American Institute, meets each Thursday evening from January 2 to February 13, in the hall of the institute, at 19 West Forty-fourth street, New York, from 7.30 to 9.45 p.m. All persons engaged or taking interest in any branch of useful arts are invited to attend these meetings and to take part in the discussions, admission being free. The regular subjects for discussion are as follows:

January 9, "Disintegrating."
January 16, "Explosive Engines."
January 23, "Springs."
January 30, "Street Corner Signs."
February 13, "Submarine Vessels."

Exhibitions and descriptions of inventions, displays of specimens of manufactures or materials and miscellaneous practical, mechanical and chemical questions will occupy the time from 7.30 to 8.30, the stated subject for discussion following. Manufacturers or inventors who believe that their machines or products are not sufficiently appreciated are invited to introduce them for discussion in order to diffuse a knowledge of their merits. Arrangements to this end can be made by communication with George Whitfield, Jr., secretary, 19 West Forty-fourth street, New York.

TRADE NOTES.

M. J. Gleason will, it is reported, build a Brass foundry in Richmond, Ind.

The Euclid Mfg. Company of Palmyra, N. J., have been incorporated with a capital of $25,000, to manufacture Refrigerators. Robert Brooke, Harry E. Bell, Louis Krause and Vivian F. Gable are the incorporators.

The Peerless Metal Mfg. Company have removed their offices from the Bank for Savings Building to 1010 Park Building, Pittsburgh, Pa.

Joseph T. Ryerson & Son, Iron merchants and agents, of Chicago, are erecting, in the western part of the city, new warehouse buildings, which will occupy a space 250 feet square. This addition to their present facilities will give the firm a storage capacity of about 125,000 tons of Iron and Steel products.

The Storrs Mica Company of Owego, N. Y., were incorporated on December 27 at Albany, N. Y., with a capital stock of $125,000.

The New Jersey Metal Company of Salem, N. J., have been incorporated with a capital stock of $10,000 by Edward C. McHenry, S. B. Dance and Sam W. Groome to manufacture Metal Caps for jars, &c.

A. L. Eccles Company, manufacturers' representatives, have leased offices in the Graham Building, 127 Duane street, New York. A stock of Hardware, Machinery, Mill and Railway Supplies will be carried by them in their warehouse in Front street. They are now representing 14 manufacturers of specialties in Machinery, Hardware and Tools, illustrated catalogues of which will be sent on application. Alfred L. Eccles, for a period of 30 years was associated with the American Saw Company, Trenton, N. J., which plant was recently purchased by John A. Roebling's Sons Company, Henry Disston & Sons, Philadelphia, having succeeded to the Saw business. James L. Neefus, for about 20 years, has at different times represented the concerns of C. E. Jennings & Co., J. C. McCarty & Co. and Alder & Boyd as city and export salesman.

PATTERN FOR SCALE SCOOP.

(Without allowance for lap.)

Almost every tinsmith is called upon once in a while to make a scale scoop with a funnel on one end. In Fig. 1 are shown the side view, section and radii of such a scoop. To make the pattern for this a correct side view of the scoop should be made, as follows: Draw any horizontal line, as L M. At right angles to L M draw the line B D, and make the distance 4 to D the same as 4 to B, then locate the points A and C, and draw lines A to B, B to C, C to D and D to A. Place the tube G H I J, as shown, and at pleasure draw the curve F K E. Then will J D E K F G be the side view of the scoop. Now with a radius equal to 4 B or 4 D and N on the line L M as center describe the circle R P O M, which will represent a section through the line B D in side view. Divide the half circle O P R into equal spaces, as shown by the small figures 1 to 7, and from which, parallel to L M, draw lines intersecting the line B D from 1 to 7, as shown. From points 1 to 5 on D B draw lines to the apex C, while from points 5 to 7 draw lines to the apex A. Where the radial lines 2, 3 and 4 intersect the curve K E, draw at right angles to L M lines intersecting the bottom of the scoop D C at 1′, 2′, 3′ and 4′. In similar manner where the radial lines 5, 6 and 7 intersect the curve K F draw lines at right angles to L M, intersecting the scoop line J D at points D, 6′ and 7′. For the pattern for one half of the scoop K E D take C D as radius and C in Fig. 2 as center and describe the arc 5 5. Draw the radial line C 1. The scoop on the line K D in Fig. 1 has only a part of the circle for its profile, as shown from 5 to 5′ in section, Fig. 1. Take the stretchout from 1 to 5 in the section and place it on either side of the point 1 in Fig. 2, as shown from 1 to 5. From these

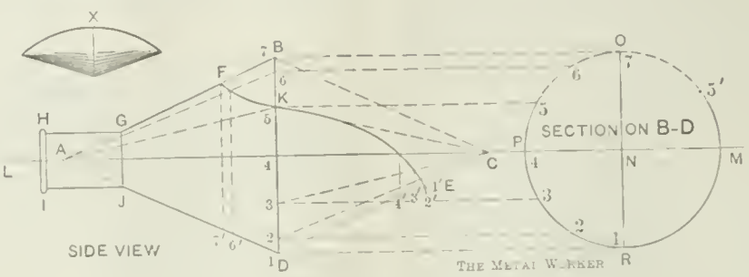

Fig. 1.—Side View, Section and Radii.

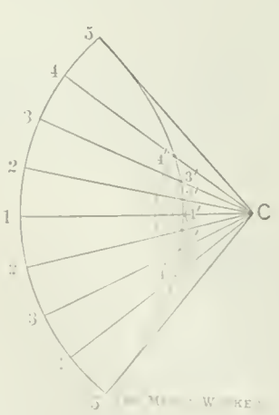

Fig. 2.—Pattern for Half Scoop K E D in Fig. 1.

small figures draw radial lines to the center C, as shown. Now with radii equal to C 4′, C 3′, C 2′ and C 1′ in Fig. 1 and with C in Fig. 2 as center intersect radial lines having similar numbers, as shown by 4′ 4′, 3′ 3′, 2′ 2′ and 1′ respectively, as shown. Trace a curved line through intersections thus obtained, as shown, from 5 to 1′ to 5, which completes the pattern. If a scale scoop were desired of a shape similar to X in Fig. 1 a duplicate of the pattern shown in Fig. 2 would be required and joined on the line K D in Fig. 1.

For the opposite half of the scoop G F K D J, take A D as radius and with A in Fig. 3 as center describe the arc 7 7. Draw any radial line, as A 1, and set off on either side of point 1 the stretchout of the semicircle R P O in Fig. 1, as shown by the small figures 7 to 1 to 7 in Fig. 3. From points 5, 6 and 7 draw radial lines to the center A. Now with radii equal to A 7′ and A 6′ in Fig. 1 and A in Fig. 3 as center intersect radial lines having similar numbers, as shown by 7′ 7′ and 6′ 6′. Trace a line through points thus obtained, as shown from 7′ to 5 and 5 to 7′. Now with radius equal to A J in Fig. 1 and with A in Fig. 3 as center describe the arc J J. Then will J 7′ 5 1 5 7′ J be the desired pattern. Allow

Fig. 3.—Pattern for Half Scoop D K F G J in Fig. 1.

edges to all patterns for wiring and seaming. The tube shown by H G J I in Fig. 1 should have a wired edge at H I, as shown.

The Amalgamated Association.

A call has been sent out for the next annual convention of the Amalgamated Association, to be held in Wheeling, W. Va., on April 15. As the secretary-treasurer is required to furnish sublodges with the programme six weeks before the convention meets, consequently all suggestions for the programme must be in the secretary's possession before February 17, 1902, or they will not appear. Delegates must be elected at the first regular meeting in March, and their names be sent to the national office. The convention this year will probably attract less attention than usual, for the reason that the strike last summer caused the loss to the Amalgamated Association of a very large number of mills and greatly decreased the strength of the organization. It is probable that strenuous efforts will be made to build up the organization among the mills of the United States Steel Corporation, but it is not believed that much headway can be made in this direction. The mills that were made nonunion during the strike last summer will very likely continue so. The Amalgamated Association is also very likely to be conservative in the matter of asking advances over present wage rates, as there will be no desire on their part to engage in another conflict.

Ninety Years Old.

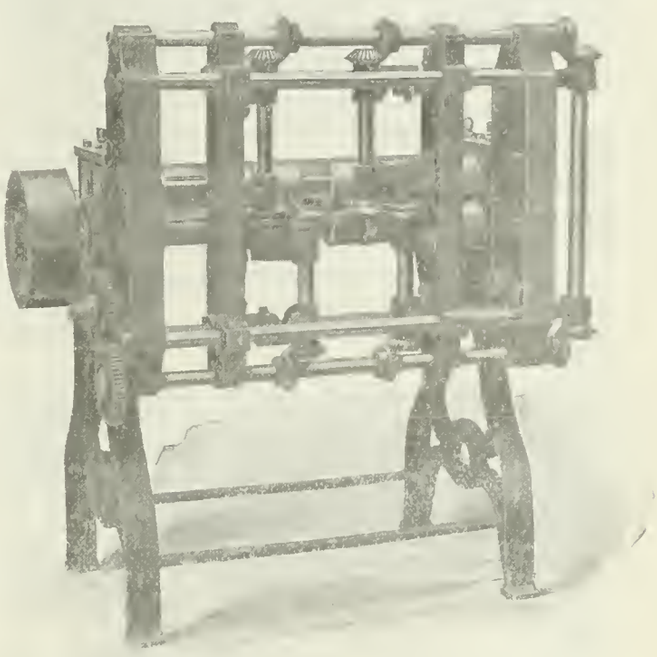
The old established and popular tin plate and metal house of Bruce & Cook, New York, are sending out their usual New Year reminder to their customers and friends in the shape of the familiar calendar bearing exterior views of their office and warehouse buildings, surrounded by the monthly date tables and a list of the extensive line of goods handled by the firm. The calendar has not varied in form from the time it was first issued 28 years ago, and its annual appearance is as that of an old friend. An interesting feature of the present issue is that it marks the ninetieth year of the existence of the house, the business having been founded by the late John M. Bruce as far back as 1812. Age with them, however, does not spell decrepitude, for the concern were never more virile and progressive than at the present day. Their many friends all over the country will join with us in heartily wishing Bruce & Cook many more years of prosperity and success.

Accompanying the calendar is a large four-page circular, on the front of which is presented the firm's New Year greeting, with their annual message to the trade. Referring to the outlook for 1902, they say: "In our estimation, the prices which are ruling at the present time are as low as can be reasonably looked for on all kinds of metals for some time to come. The condition of the steel market would seem to warrant higher prices for this product in the near future. The very large demand for steel product, the inability of the railroad companies to handle promptly the enormous traffic, indicates that the country is still in a very prosperous condition, which appears likely to continue during the present year."

The rest of the circular is devoted to a list of all the goods handled by the firm and also of some of the principal items which they have in stock in New York ready for immediate shipment, including coke tin plates, taggers iron, roofing plates, Allaway and Melyn grade charcoal plates, black and galvanized sheets, polished steel sheets, American planished iron, genuine Russia iron, market wire, solder and sheet zinc. A list is also given of coke tins which can be shipped promptly from the mills in the Pittsburgh district.

Drawback on Stamped Steel Ceilings.

Under date of December 30, O. L. Spaulding, Assistant Secretary, has rendered the following decision:



On the exportation of stamped steel ceilings, in which term are embraced coverings for side walls as well as ceilings, and all kinds of moldings, cornices, friezes, rosettes and other decorative designs, manufactured by Henry S. Northrop of New York, wholly with the use of imported steel sheets, by the processes of trimming and stamping or embossing, to which afterward may be added a thin coating of paint, a drawback will be allowed equal in amount to the duty paid on the imported steel used, less the legal deduction of 1 per cent.

In liquidation, the weights of imported sheet steel of the several gauges which may be taken as bases for allowance of drawback may equal the net weights declared in the drawback entry, after official verification; provided that in case any of the merchandise has been painted, 6 per cent. of its net weight shall be deducted therefrom to find the actual weight of steel exported.

THE recent incorporation of the William B. Scaife & Sons Company, under the laws of New Jersey, with a capital stock of $850,000, was made in order to convert the copartnership heretofore existing into a stock company, to increase the capital and extend the operations of the concern. The principal interest in the company, which at present is held by William B. Scaife, Jr., C. C. Scaife and C. C. Scaife, Jr., will continue in the incorporated company. The concern are one of the oldest in their line, having been established just 100 years ago. They do a wide range of business in the line of Architectural Iron Work, Sheet Iron, Range Boilers, Air and Gas Pressure Tanks and various specialties.

Automatic Sheet Steel Edging Machine.

The automatic sheet steel edging machine of which an illustration is given herewith has recently been patented, and is now being manufactured by the Canton Machine & Mfg. Company, Canton, Ohio. The machine is especially designed for edging galvanized sheets used in the manufacture of corrugated and plain conductor pipe in all the standard sizes, and of any length. It is described as swift in operation, and is claimed to do four times as much work as any other similar machine. Moreover, it only requires the labor of one person to feed the sheets to the machine. The machine is substantially constructed of the best materials. All the gears are cut, and working parts made from the best tool steel. Its

Automatic Sheet Steel Edging Machine.

capacity is guaranteed to be 100,000 feet per working day of ten hours, and it will edge iron No. 26 gauge and lighter.

A New Sheet Metal Working Firm.

Beseman & Bostwick are a new firm in the roofing, cornice and skylight business, at 44 Ann street, Hartford, Conn., having bought the business of the Cullen Cornice & Skylight Works, to which they will add that of plumbing. The firm are composed of E. J. Beseman and J. Bostwick. Mr. Beseman has worked in the metal working shops in many of the large cities throughout the United States for the past 18 years. Of late he has held the position of expert pattern cutter and estimator in the shops of W. E. Disley, at Waterbury, Conn. Mr. Bostwick is thoroughly familiar with the office side of the business, having been for several years Mr. Disley's head bookkeeper. He is also experienced in plumbing and heating work. The new firm have purchased a business stand where a reputation was built up for high grade work. Some of the finest architectural sheet metal construction in New England has been made in this shop. The new firm are well qualified to continue and add to this reputation.

THE NEW PROCESS MFG. COMPANY of St. Louis, Mo., and Dallas, Texas, have favored us with a collection of circulars illustrating and describing the varied lines of goods which they are manufacturing. These include Steel Tanks, Awning Brackets, Corrugated and V Crimped and Roll Cap Steel Roofing, the Superior Steel Cistern, New Process Steel Watering Trough, Imitation Pressed Brick Siding, Flatau's Patent Steel Roofing and Siding, and Brewer's Graphite Elastic Roof Paint,

adapted for tin shingles, iron and felt roofs, smoke stacks, boilers, &c. The company advise us that they are contemplating getting out a catalogue of their goods in the early part of this year.

FLASHINGS.

The special partnership of Lyon, Conklin & Co., Baltimore, Md., having expired by limitation on January 1. W. L. Lyon, C. T. Lyon, D. E. Conklin and C. A. Conklin have formed a special copartnership for the purpose of carrying on a Tin Plate and Metal business under the former title.

The Consumers' Can Company, with office at 15 Exchange place, Jersey City, N. J., have been incorporated with a capital stock of $400,000, by Edgar Kirwin, William C. McGhee, Nicholas S. Turner and Frank M. Dermott, to manufacture Metal Cans.

The Allegheny Steel & Iron Company of Pittsburgh, Pa., will increase their Steel making capacity, by the addition of another open hearth furnace, with a daily capacity of 50 tons. The company also propose making a material increase in their Sheet rolling capacity, which at present is from 40 to 50 tons per day.

The offices of the Youngstown Iron, Sheet & Tube Company of Youngstown, Ohio, have been moved from their plant, at Haselton, to the Federal Building, Youngstown.

John F. O'Dea, assistant general manager of the plant of the Youngstown Iron & Steel Roofing Company of Youngstown, Ohio, resigned his position on January 1, and will devote his time to a new project, of which he is to be the head. Mr. O'Dea was one of the founders of the Youngstown Iron & Steel Roofing Company.

The Hampden Cornice Works, Springfield, Mass., have the contract for the Sheet Metal work on the new operating building at the Dickinson Hospital in Northampton.

The new Tin Plate plant which the McKeesport Mfg. Company of McKeesport, Pa., are about to erect at Port View, will be begun within a short time, under the supervision of Edward Crawford of Duquesne, who was formerly connected with the United States Tin Plate Works, at Demmler, Pa.

The Midland Works of the American Sheet Steel Company gave a banquet on New Year's Eve at the Country Club, at Muncie, Ind., to the superintendents, foremen, shippers, office force, and their wives, Mr. and Mrs. Ambrose Beard acting as host and hostess. The affair was unusual in the Indiana town and was so thoroughly enjoyed that much favorable comment resulted. No detail was omitted that would tend to the pleasure and comfort of guests, even to sending home the young people on a special electric car and the older people to their doors in cabs. Mr. Beard made a brief address that was well received. He thanked his assistants for their co-operation in producing good results and pointed out the many benefits that were derived from harmonious work. He also suggested that the old worn out saying about corporations having no soul be forgotten. He had found it to be true only in isolated cases, and certainly not in that of the American Sheet Steel Company.

If the weather continues mild, it is probable a part of the large new plant of the Youngstown Iron, Sheet & Tube Company, at Youngstown, Ohio, will be started immediately.

Ira B. Smith, Bristol, Conn., finding his facilities inadequate to supply his rapidly increasing trade, has erected a modern factory building. Mr. Smith is now equipped to do all kinds of Sheet Metal stamping and pressing, also dies and tools of every description, patterns, electro-plating, &c.

The Cadwalader Tin Plate & Metal Company of Pittsburgh will apply for a charter on January 28.

Early on the morning of January 4 fire broke out in the Pipe and Gutter factory of Berger Bros. Company, Seventeenth and Clearfield streets, Philadelphia, and gained considerable headway before discovery by the employees of an adjoining works. The Fire Department was prompt in responding to the alarm and quickly had the blaze extinguished, but not until a small section of the second and third floors had burned through and the nearby stock had been damaged. The cause of the fire is unknown, but presumably it came from outside sources, either from passing locomotives or an adjoining forge works. No hands were thrown out of work and everything will be running in its usual order within a few days. The loss is principally on the building, which as near as can be estimated, will range from $1000 to $1500.

Good Advertising.

There is advertising and good advertising, says the *Ironmongers' Chronicle*. In other words, it is possible to spend large sums of money on advertising and to reap no benefits therefrom, and it is also possible to build up a large business by means of a gradual and properly developed system of advertising. Many kinds of advertising are open to manufacturers, but the advantages of using trade journals as advertising mediums are so obvious that we can allude to the subject without fear of being accused of self interest. To reach the trade the trade paper must be employed, and to reach the cream of the trade the best journal and one which has attained a high degree of popularity should be selected. It is of little use to advertise the manufacturer's name and address, and with a brevity—not commendable—state that the advertiser "makes tools or implements." What is wanted is to impress readers with some special qualities of production, remind them of seasonable lines, lead them to ask for quotations, and either by judicious wording or pictorial illustration induce them to associate that firm and that firm alone as the best maker of those particular goods. The makers of novelties and specialties may go further, and stamp upon the minds of their readers the real sterling merit of the goods they offer, and above all, by illustration and description, leave a clear impression on the minds of all who study the advertisement of what the article is like, and to what extent it is likely to become popular. Goods should sell because of their merits, and a clear, living advertisement should be like a clearly explained description. Indeed, those who "live by advertising" say a properly drawn advertisement is equal to a verbal description by an eloquent salesman.

English the World's Language.

Two-thirds of the letters which pass through the post offices of the world, says *Bradstreet's*, are written by and sent to people who speak English. There are substantially 500,000,000 persons speaking colloquially one or another of the 10 or 12 chief modern languages, and of these about 25 per cent., or 125,000,000 persons, speak English. About 90,000,000 speak Russian, 75,000,000 German, 55,000,000 French, 45,000,000 Spanish, 35,000,000 Italian and 12,000,000 Portuguese, and the balance Hungarian, Dutch, Polish, Flemish, Bohemian, Gaelic, Roumanian, Swedish, Finnish, Danish and Norwegian. Thus, while only one-quarter of those who employ the facilities of the postal departments of civilized governments speak as their native tongue English, two-thirds of those who correspond do so in the English language. There are, for instance, more than 20,000 post offices in India, the business of which in letters and papers aggregates more than 300,000,000 parcels a year, and the business of these offices is done chiefly in English, though of India's total population, which is nearly 300,000,000, fewer than 300,000 persons either speak or understand English.

The New York Blower Company of Bucyrus, Ohio, have just completed one of the largest heating apparatus outfits ever built, for the new plant of the Brown Hoisting Machinery Company of Cleveland. The blower company have contracts on hand which will keep them very busy for three months.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

ALLOWING LAPS ON PATTERNS.

From W. F., Washington.—Referring to the article on "Allowing Laps on Patterns" in *The Metal Worker* of December 21, I beg to differ from the writer as to the proper allowance to be made for wire and laps.

First.—As to wire, in addition to the pattern, material must be allowed equal to two and one-half times the thickness of the wire, to provide for covering wire properly, instead of three times, as described.

Second.—As to laps, for simply soldered seams, sufficient lap outside the net pattern on one side is all that is required.

Third.—For riveted and grooved joints, one-half the seam should be allowed on either side of the net pattern, so that rivet holes punched should come with their centers on the net lines of the patterns.

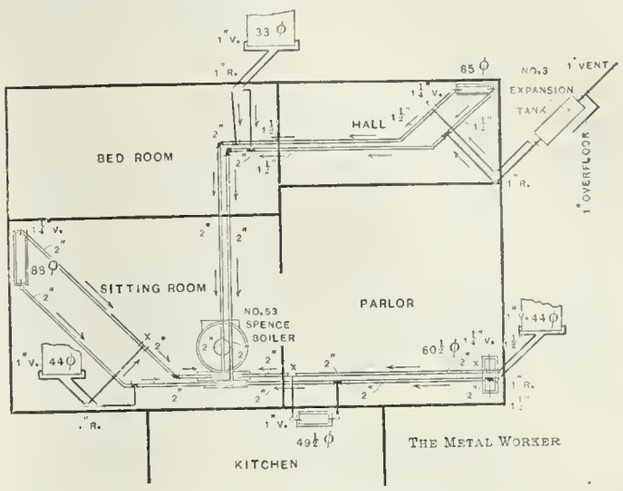
Fourth.—For grooved seams, exactly one-half of whatever the grooved seam will take up should be allowed on each end of the pattern.

These are the simplest ways of cutting correct patterns, as proved by more than 50 years' practice. As a sample, I may mention that patterns after this rule for sets of measures, the sizes of which I figured out according to very simple rules, have always proved themselves absolutely correct.

Answer.—Taking up the questions in the order presented we would say: While our correspondent in his practice may use two and one-half times the thickness of the wire for wiring that does not change the fact that three times the thickness of the wire brings the metal tight and snug around the wire and against the body of the article to be made.

The second point is exactly in accordance with what was presented in the article mentioned.

In reference to the third point made, it is immaterial whether the rivet holes come directly on the net lines of the pattern, so long as the net lines of the pattern will meet when the article is rolled up and the rivet holes fit over each other.



The answer to the third criticism also applies to the last one, it making no difference whether one-half the amount of groove is placed on either side, or single edge on one and double edges on the other, so long as the net lines of the pattern will meet when the article is grooved together.

We appreciate our correspondent's suggestions, giving his methods of allowing laps, which, however, do not imply any error in the method described in the article referred to.

WHAT EMPTIES HOT WATER SYSTEM?

From A. B., Lake City.—I have installed a hot water system according to the piping plan presented herewith. When I fire up strong the thermometer shows that the water starts out from the boiler at a temperature of 220 degrees. Then the water expands and starts out of the overflow pipe of the expansion tank, which acts as a siphon and takes all of the water out of the plant. What is the cause of the trouble, and how can it be remedied?

Note.—We shall be glad if our friends in the heating trade will give their views as to the cause of the trouble. In the meantime we would suggest that the vent pipe from the expansion tank be examined to see that it is open. If the overflow pipe leads from the expansion tank down to the ground, or is connected with a soil or waste pipe, there should be a break in it near the top, so that air can enter to break siphonage. If the boiler capacity is greatly in excess of what would be required for the radiation used in the heating system, and it would be necessary to heat the water very hot to warm the building, it might be possible where small flow and return pipes were used that steam would be generated in the boiler in sufficient quantity to lift the water out of it and expel it from the system if the steam generation was

What Empties Hot Water System?

continued. Apparently there is nothing in the piping that would cause the trouble reported.

PROPORTIONS FOR DELIVERY MILK CANS.

From W. N., New York.—Replying to your correspondent "Proportionist" of Devon, England, who in *The Metal Worker* of November 30, 1901, asked for proportions for delivery milk cans, I inclose two diagrams of 1-quart (United States) kettles, showing side handle on one. While the proportions shown may be pleasing to

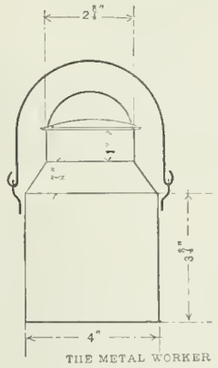


Fig. 1.—With Bail Handle.

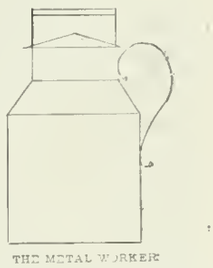

Fig. 2.—With Side Handle.

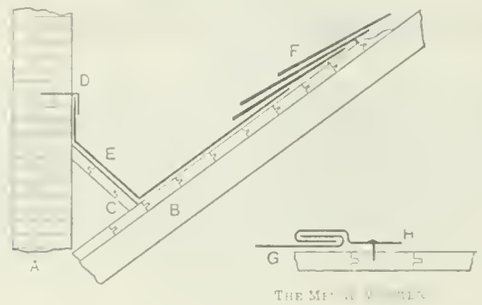
Proportions for Delivery Milk Cans.

one they may not suit another. But, as the kettle should hold a quart, if the diameter is made greater the hight would be less, while if the diameter is less the hight must be greater, so as to have the required number of cubic inches.

HOW MANY HOT AIR PIPES?



From H. L. N., Pennsylvania.—I should like to know through *The Metal Worker* how many hot air pipes will be needed to heat a three-story building. The first floor is a store, 26 x 30, and 10 feet high; the second floor is a dwelling 8 feet high, and the third floor is a hall 8 feet high, the pipes to be run between the joist and studding. Could I have three registers on one upright pipe; or would it be necessary to run extra pipes?

Note.—There is hardly as much information as to the character of the building and its arrangement as would be needed to answer the question of our correspondent intelligently. *The Metal Worker* has frequently pointed out that large hot air pipes and large vertical stacks or flues furnish the best results in furnace heating. For the work in question a large register in the floor of the store would give the best results, and for a store of this size the piping leading to the register should not be less than 14 inches in diameter. If the store has a large

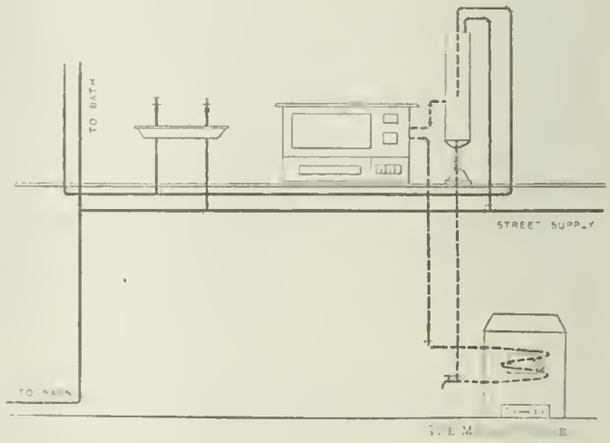
show window and other windows it might be necessary to have a still larger pipe, or two pipes, to heat it. Inasmuch as it is probable that the hall in the upper part of the building will be over warm rooms, it is possible that one 14-inch round pipe from the furnace will furnish all the heat that is required, provided a flue of sufficient dimensions is used from the round pipe in the cellar to the register in the hall. It may be necessary to extend a breast out into the building to contain the flue that runs to the third floor, which can also be used for heating the rooms on the second floor. The flue for the hall should not be less than 8 x 14 inches. This breast should be arranged to come up between two rooms on the second floor so that two upright flues for heating rooms in the dwelling could be on each side of it. Sizes of pipes and vertical flues for heating the dwelling can only be determined on knowing the size of the rooms and their number.

LINING GUTTERS WITH COPPER.

From N. L., Middletown, Conn.—I have two gutters to line with 16-ounce copper, each 75 feet long. One side turns up against a brick wall, while the other side turns up under the slate roof. The width of the gutter requires 84-inch copper, and I propose using sheets 30 x

Lining Gutters with Copper.

84 inches. To allow for the expansion and contraction of the metal, would it be best to counterflash and cleat the sheets or nail them? Please inform me through *The Metal Worker* of the best way to lay in the copper which will allow for expansion and contraction.



Answer.—Under no consideration should the copper lining be nailed to the sheathing. When the walls at the side and two ends, shown by A in the accompanying illustration, are carried up as far as D, build in a cap flashing as there shown. The carpenter should then line out the gutter or valley with smooth sheathing warranted not to shrink, as shown by B and C, being careful to have a good pitch toward the leaders. The copper lining E is then put in position, slipping one end under the cap flashing D, and the other under the slating F. We would suggest using copper 36 inches wide in place of 30 inches, as this will save a seam on every five widths. Where the cross seams occur the sheets should be thoroughly tinned 2 inches wide on both sides and a lock placed thereon and fastened with cleats, as shown in the illustration, where G represents the sheets fastened by the cleat H, and nailed to the sheathing at I. In no case should the sheet be nailed directly to the wood lining, because the expansion and contraction of the metal would cause the copper to tear out at the nail. By using cleats the copper has a chance to expand with the heat of the sun and contract with the cold, the portions under the cap flashing and slate being entirely free. When the locked seams are thoroughly closed with the mallet use heavy coppers and thoroughly soak the seams with half and half solder, raising the cap flashing slightly to allow the soldering of the upright seam. Then lay a smooth board about 6 x 12 inches over the cap flashing and dress down well with the mallet.

WHAT IS THE BEST ROOF COVERING FOR ROUNDHOUSE?

From I. E. D., Atlantic, Iowa.—In reply to the inquiry of "W. M.," in *The Metal Worker* of December 14, for a good roof for a roundhouse, I would recommend slate or tile for such roofs. But their weight necessitates a heavy structure to support them, making the roof very expensive. If "W. M." will first put on the sheeting thoroughly dried matched pine flooring, and then give it a good heavy coat of paint, consisting of 5 pounds of Venetian red and 1 pound of litharge to 1 gallon of linseed oil, and allow it to dry thoroughly, he will be ready for the next step. After the paint is dried a good grade of felt paper should be laid over it. He then can put on a roof with flat seams, using tin plate of a good brand, not more than 14 x 20 in size. This should be well painted on the underside with the same paint that was used on the sheeting. But the paint should be kept well stirred while it is being used. If he follows these suggestions I think the roof will give as good satisfaction as a roof made of any other kind of material. Of course it is very necessary that the roof should be put on by a reliable workman. It should be nailed every 4 inches, and should have ½-inch lock at the beams. It should be soldered with about 5½ pounds of solder to the square, using good heavy soldering coppers that will soak the solder in good. I would use for the flux muriatic acid cut with zinc until it will use no more zinc, then further dilute by the use of one-third its bulk in clean soft water. After the roof is completed it should be carefully painted, when it will be found to be less expensive than the heavier roofs, and with care should prove just as durable.

COLD WATER FROM BOTH FAUCETS.

From I. D. H., Sun Prairie, Wis.—There is a hot water service system in a residence here which is evidently arranged wrong, as hot and cold water come from both faucets. The sketch herewith shows the location of the different fixtures. We desire to heat the water by means

Cold Water from Both Faucets.

of a pipe coil in the furnace in the winter season, and by means of a water back in the range in the summer season. Kindly give a sketch showing the proper arrangement of pipes and connections with the range and furnace.

Answer.—Sometimes, when hot water can be drawn at the cold water faucets, it is because the delivery tube connected with the cold water supply to the boiler has dropped down inside the boiler, or has not been put in place. Under such circumstances the cold water often rushes into the boiler and out through the hot water pipe. Again, where the pipes are long and exposed the water in the hot water pipe will cool and considerable cold water will come before the hot water flows. If the piping, however, is arranged as shown by the dotted lines in the sketch there will be a positive circulation between the boiler and the water heaters, and no danger of cold water ever flowing from the hot water pipe, except the water that is cooled in the hot water pipe, and this can be largely reduced by covering the pipe to protect it from the cold air.

To harden small tools or articles that are likely to warp in hardening, says *Shop Talk*, heat very carefully, and insert in a raw potato, then draw the temper as usual. A bar of hard soap is also good, but will not make the tool as hard as the potato will.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is weak and dull, and about ½c. lower.

Copper is still weak and unsettled, with further decline anticipated.

Pig Lead is quiet and unchanged.

Spelter continues in light demand, but firmer for spot.

Antimony is without change.

Nickel continues firm and unchanged.

Aluminum is active at former prices.

Tin Plates are quiet and without change.

Sheets have stiffened again and continue in large demand.

Sheet Copper is quiet on the decline.

Sheet Zinc is in moderate demand at former prices.

Pig Iron is very active and strong; Foundry Pig at Pittsburgh is 50c. higher.

Scrap Iron is active and stiffer in price.

Old Metals are dull and weak.

Rolled and Sheet Brass is 5 per cent. lower.

Brazed Brass Tubes have been reduced 5 per cent. in price.

Seamless Brass and Copper Tubes are down 3c. per lb.

Brass Wire and Rods have been reduced 7½ per cent.

Salt Glazed Sewer Pipe is the subject of a new price-list, which contains several changes.

Lead Pipe prices were reaffirmed this week.

Plumbers' Brass Goods are dull, with likelihood of lower prices.

Soldering Coppers have been reduced in price.

Solder is about ½c. lower.

Building Papers have been advanced in price.

Wire Nails are stronger.

Cut Nails are in moderate demand and unchanged as to price.

Wire is in heavy demand at former prices.

Window Glass is dull, with uncertainty as to prices.

White Lead prices are irregular.

Linseed Oil was advanced 5c. per gallon.

Spirits Turpentine is unchanged and firm.

METAL MARKET.

NEW YORK, January 10, 1902.

Pig Tin.—A weak and declining market characterized the week under review. Business was very light and prices made a further decline as compared with those of a week ago, notwithstanding a spurt of improvement in London on Wednesday. The reaction, however, was of very short duration and prices settled back again to the lowest level reached for some time past. Jobbers' prices for Straits Pig in small lots were quoted at 23¾c. to 24¼c. per lb.

Copper.—The market has remained in the unsettled state which has marked it since the first cut in prices at the end of last year. At the close of the week a rumor was prevalent that another cut in Copper had been decided upon by the principal selling interests. It is understood that concessions are being offered by producers, but the trade do not seem to be taking advantage of the shading in values, anticipating a still further decline in the near future. The opinion is freely expressed that the present price of Copper is at least 2c. above bottom prices. Lake Ingot is selling in a retail way at about 13½c. to 14c. per lb., and Casting Copper is 13¼c. to 13¾c. These prices, however, must not be assumed as accurately representing the present market rates, for business is so light that there is really no market for Ingot Copper. Following is the table of annual Copper statistics, as compiled by the New York Metal Exchange, in gross tons:

Supplies.	1901.	1900.	1899.
*Domestic production, as per producers' returns	266,452	268,787	262,206
Net importations of foreign	61,286	38,182	39,858
Total supplies	327,738	306,969	302,064
Exportations.			
Exports of domestic to Europe	92,408	151,988	112,637
Exports of domestic to British North America	616	688	435
Exports of domestic to Mexico	85	151	130
Contents of sulphate	5,338	4,852	2,392
Total exportation	98,447	157,679	115,594
Deducting exportations from supplies, there were available for home consumption	229,291	149,290	186,470

* Domestic production for December estimated.

Sheet Copper.—The reduction of 3c. in the price of Sheet Copper, made on January 2, has, so far, had but little effect in stimulating the demand, which is naturally light at this season of the year. It is expected, however, that orders will soon begin to come in, provided consumers become satisfied that the existing base price of 18c. for Sheet Copper is likely to hold.

Pig Lead.—There was no change in the Lead situation here. The market remains very quiet, business being confined to small purchases for current use. Prices are unchanged, jobbers quoting small lots of American Pig at 4.40c. to 4½c. per lb. St. Louis advices report a more settled condition in Pig Lead in that market.

Spelter.—A very light demand for Spelter is noted, but the market showed a firmer tone as to spot metal. Jobbers quote good Western brands in small lots at 4⅝c. to 4¾c. per lb. St. Louis advices are to the effect that the Spelter market there has lapsed into quietness, and that prices have sagged off to some extent.

Sheet Zinc.—The demand for Sheet Zinc is of fair proportions, and prices are unchanged. Jobbers quote 600-lb. lots at 6¾c., and smaller quantities at 7¼c. per lb.

Antimony.—There is no change in this metal, Cookson's in small parcels is quoted at 10½c. to 11c., and Hallett's at 8¼c. to 8¾c. per lb.

Nickel—Is unchanged, continuing on the basis of 60c. to 65c. per lb. for small lots.

Aluminum.—Manufacturers of Aluminum report a continued active and steady demand for this metal. Prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure rule at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The feature of the Tin Plate market this week was the announcement by the American Tin Plate Company of their readiness to take orders for Plates for delivery in the second quarter of this year at present prices. Large business was of very moderate proportions, but a fair degree of activity was noted in the retail demand, which is larger than is usually the case thus early in the year. American Bessemer Coke Plates, IC, 14 x 20, in small lots, delivered at New York and corresponding points, are selling at about $5 to $5.25 per box. A further decline of 3 pence per box in the price of Welsh Plates was noted this week, bringing them down to 12 shillings 6 pence, f.o.b. Swansea.

Sheets.—The scarcity and high prices of Steel, together with the fact that the demand for Sheets always increases in the first two or three months of the year, has given the market a decidedly stronger tone, and some comparatively low prices made by some of the outside mills were withdrawn this week. Some large contracts for Sheets for extended delivery are being placed with the mills, and there is every reason to expect that the market will retain its firmness for some time to come. While deliveries from mills are coming in rather more freely, they do not yet suffice to entirely meet the requirements of consumers, and the scarcity of some sizes is still felt. Prompt deliveries on both Black and Galvanized Sheets are still hard to get and

command premium prices. Jobbers are quoting No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots at 4c. to 4.05c., and Galvanized Sheets at 65 to 67½ per cent. off the list.

Chicago advices are as follows: The inquiry is stronger, but the number of independent mills has increased to such an extent that their competition for business is becoming noticeable. A good demand is enjoyed by jobbers, but even for this class of trade the competition is growing a little sharper. Small lots of No. 27 Black Sheets are quoted at 3.50c., and Galvanized at 70 to 70 and 5.

St. Louis reports as follows: At the opening of the new year the market for Sheets is showing a stronger and more active condition, with prices holding at former level. Jobbers quote Stove Pipe size, No. 27, 3.45c. to 3.50c., and Galvanized Sheets, 65 and 10 off.

Old Metals.—The scarcity and high price of Pig Iron have caused a larger demand for Scrap Iron, with a stiffening in price. Old Metals of other descriptions are in light demand and prices unsettled. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10 c.
Light and Tinned Copper	per lb. 8¼c.
Heavy Brass	per lb. 7¼c.
Light Brass	per lb. 6 c.
Lead	per lb. 3¾c.
Pea Lead	per lb. 3¼c.
Zinc	per lb. 3 c.
No. 1 Pewter	per lb. 16 c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	$6.00 to $6.50
Wrought Iron Scrap, per gross ton	11.00 to 11.50
Heavy Cast Scrap, per gross ton	10.50 to 11.00
Stove Plate Scrap, per gross ton	8.00 to 8.25
Burnt Iron, per gross ton	5.50 to 5.75

THE PIG IRON MARKET.

New York.—Additional quantities of Foundry Iron have been purchased by some of the larger interests. The scarcity of Pig Iron for immediate delivery is becoming more pronounced. It is expected that the price of Southern Pig Iron will be generally made $12, Birmingham, for No. 2. We quote for Northern Irons: No. 1, $16.50 to $17.50; No. 2X, $16 to $16.50; No. 2 Plain, $15.50 to $16; Tennessee and Alabama brands, No. 1 Foundry, $16.25 to $16.75; No. 2 Foundry, $15.75 to $16; No. 1 Soft, $16.25 to $16.75; No. 2 Soft, $15.75 to $16; No. 3 Foundry, $15.25 to $15.50; No. 4 Foundry, $14.75 to $15.

Chicago.—Inquiries are numerous, but business is checked by the hesitation of manufacturers who feel themselves unable to take contracts for delivery during the next three or four months, because of the Coke scarcity. Lake Superior Charcoal Iron is in strong demand, several sales of round lots being reported, while a great deal of business has been done in small lots. The foundries in the Northwest are now using Charcoal Iron for ordinary castings, because of the difficulty in securing Coke Iron. Some sales are reported by both Northern and Southern companies for delivery during the last half of the year. Nearly all Southern furnace companies have now advanced their prices to our maximum quotation. It is claimed that practically no Iron can be had at the inside figures. We quote as follows:

Lake Superior Charcoal	$19.25 to $19.50
Local Coke Foundry, No. 1	16.00 to 16.50
Local Coke Foundry, No. 2	15.50 to 16.00
Local Coke Foundry, No. 3	15.00 to 15.50
Local Scotch, No. 1	16.00 to 16.50
Ohio Strong Softeners, No. 1	17.60 to 17.85
Southern Silvery, according to Silicon.	16.15 to 16.40
Southern Coke, No. 1	15.65 to 16.15
Southern Coke, No. 2	15.15 to 15.65
Southern Coke, No. 3	14.65 to 15.15
Southern Coke, No. 1 Soft	15.65 to 16.15
Southern Coke, No. 2 Soft	15.15 to 15.65

Philadelphia.—Under the unsettled conditions of the Pig Iron market, due to the difficulty in securing sufficient transportation facilities, prices are very much unsettled, and it is impossible to fix upon any standard at the present time, each and every transaction being made upon its own merits. For prompt shipment $16.75 to $17 is quoted for No. 2 X Foundry, and a number of sales have been made on this basis. Some holders are very cautious in quoting on large lots, as they are considering whether $18 Iron may not be seen before the end of the month. Iron is very scarce, and sellers can get pretty nearly their own price for prompt shipments. For three to six months' contracts prices will be about as follows for New York and nearby points: No. 1 X Foundry, $17.25 to $17.50; No. 2 X Foundry, $16.50 to $17; No. 2 Plain, $16 to $16.50.

Pittsburgh.—Deliveries of Coke to the furnaces have been better than for some time and it looks as though the worst of the trouble might be over. Foundry Iron for first quarter delivery can hardly be had at any price, as the furnaces are so well sold up that they have very little Iron to spare. We quote Standard Bessemer Iron at $16.75 and No. 2 Foundry at $16.50 to $16.75. Pittsburgh.

Cincinnati.—There has been no holiday respite in the Pig Iron trade this season. Selling has been continued right through the usual dull season on a very liberal basis. The amount of Iron sold has been gauged, in the main, by the amount of stock the different furnaces have had to offer, and deliveries are contracted covering well nigh the entire year. In prices there is hardly the uniformity that was presented a few weeks ago; the leading Southern interest still holds to the $11.50 base for No. 2, while other furnaces have advanced 50c. over that figure. The market is exceedingly strong and the outlook for activity as bright as it has been. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$14.75 to $15.25
Southern Coke, No. 2	14.25 to 14.75
Southern Coke, No. 3	13.75 to 14.25
Southern Coke, No. 4	13.25 to 13.75
Southern Coke, No. 1 Soft	14.75 to 15.25
Southern Coke, No. 2 Soft	14.25 to 14.75
Southern Coke, Gray Forge	13.25 to 13.75
Southern Coke, Mottled	13.25 to 13.75
Ohio Silvery, No. 1	16.25 to 16.75
Ohio Silvery, No. 2	15.75 to 16.25
Lake Superior Coke, No. 1	16.60 to 17.10
Lake Superior Coke, No. 2	16.10 to 16.60
Lake Superior Coke, No. 3	15.60 to 16.10

St. Louis.—Very heavy buying has marked the opening days of the year. Since our last report an advance of 50c. per ton on all grades has been put into effect. Better than 30-day deliveries are out of the question, and then the tonnage of such shipments is necessarily small. Practically all the furnaces are sold up for the first three months, and heavy requirements are booked through the first half. Several contracts are to be noted covering requirements for the last half of the year. It is said that the transportation feature shows slight improvement. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$16.00 to $16.25
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50
No. 1 Soft	15.75 to 16.00
No. 2 Soft	15.25 to 15.75

CHICAGO REPORT.

Scrap Iron and Steel.—Prices are strong, in sympathy with the strength of new Iron and Steel. Cast is in particularly good demand. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$11.00 to 11.50
Machinery Cast	10.50 to 11.00
Malleable Cast	10.00 to 11.00
Stove Plate (free from burnt)	8.00 to 8.50
Burnt Iron and Grate Bars	5.50 to 6.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	.... to 10.00
Breaking Stock	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c	.... to 7.00
Old Boilers—whole (Iron)	6.50 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to 11.00
Old Gas Pipes and Boiler Tubes	10.50 to 11.00
Cast Borings	4.50 to 5.00
Turnings	9.50 to 10.00
Horseshoes	12.00 to ....

Old Metals.—Business is almost at a standstill, consumers being afraid to buy and dealers refusing to take losses on their stocks bought at high rates. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	10 c.
Copper Bottoms	8¼c.
Copper Clips	10 c.
Red Brass	9¼c.
Yellow Brass	7½c.
Red Brass Borings	9 c.
Yellow Brass Borings	6¼c.
Light Brass	6¼c.

Pipe Lead	3.55c.
Tea Lead	3¼c.
Zinc	3 c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.

Old Rubber.—Very little is now doing. We quote as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	46.00	.....
Rubber Shoes	....	7 c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6¾c.
Black Rubber	....	4¼c.
White Rubber	....	8½c.

Rags.—Dealers quote buyiug prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in auy quantity.

Anthracite Coal.—A medium trade is in progress, the weather being mild throughout the West. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo.	8.25	8.50

THE HARDWARE TRADE.

Notwithstanding the short time which has elapsed since the opening of the year there is already a quickening in the demand, and merchants are evidently getting ready without delay for the business which will soon be upon them. The number of travelers who have entered upou their routes is increasing from day to day, and very satisfactory reports are begiuning to come in from those who were earliest in the field. It is assumed that most houses are finding that last year was a profitable one and that its results will enable them to prosecute business with renewed vigor and enterprise. There is a disposition to order goods in advance of actual need, as in many lines there has been delay in shipment on account of mauufacturers beiug unable to turn them out in sufficient volume to meet their customers' requirements. The difficulty whlch manufacturers have had in procuring raw material is one of the causes of this condition, and even at the present time after the holiday lull in the demand there is still much complaint by them on this score. This naturally influences goods iu the matter of price, especially those lines in which the large proportion of the cost is iron or steel, and the market ls rendered decidedly strong. There is some reason to anticipate further advances in some of these lines, notwithstanding the fact that most representative manufacturers regard with dlsapproval any movement toward higher prices, knowing that it will be followed sooner or later by an inevitable reactiou.

Hardware generally is held at satisfactory prices, feeling the effect of the existing state of things ln the iron market and the large volume of busiuess which has been dolng and is expected during the season. The labor cost of goods is unobtrusively but steadily increasing, inasmuch as while there are but few open advances, practically every Hardware manufacturer finds it necessary to increase wages in individual cases or in certain departments from time to time. Some kinds of heavy goods which have been exceptionally scarce are in better supply, and it is possible where these have been held at high prices, owing to the practical control of the market pendlng the development of outside competition, that with the entrance into the field of compoting products a revision of prices may result. Some lines which have been more or less weak on account of reaction from such hlgh prices are apparently finding their level and a more confident tone is prevailing with more ruglar prices. If the volume of business is at all up to expectations there will be undoubtedly a scarcity in several branches of the trade.

The Trenton Porcelain Company of Trenton, N. J., have been incorporated with a capital stock of $100,000 by Franklin H. Burroughs, George E. Maguire and George F. Fell to manufacture Pottery.

NOTES ON PRICES.

Lead Pipe.—At a meetiug of the Eastern Lead Pipe Association, held in New York on Tuesday, January 7, the price of Lead Pipe was reaffirmed. It is believed that no change will be made in the price of this material in the future unless Pig Lead values should decline radically, which seems unlikely. The demand for Lead Pipe aud Sheet Lead has been excellent and the outlook for a large cousumption in 1902 is thought to be favorable.

Plumbers' Brass Goods.—The sharp decliue iu Copper will, it is expected, cause the announcement of lower prices on Plumbers' Brass Goods after the meeting of the Executive Committee of the Brass Goods Manufacturers' Association, scheduled for the 14th inst. A revisiou of prices based on 13-cent copper is thought likely. The demaud for Brass Goods, as is uatural under the circumstances, has fallen to a very small volume. Buyers are not taking anything iu this line beyond what their immediate needs dictate.

Soldering Coppers.—The price of Soldering Coppers has fallen, in sympathy with the decline in Ingot Copper.

Tinware.—The trade are watching the Tinware market in anticipation of advanced prices, as the result of the conferences, which, it is uuderstood, have been taking place between the manufacturers. Practically all articles in the line of Sheet Metal Household Goods are held very firmly, and it is anticipated that higher prices may be announced in the near future. Trade is still feeling the effect of the strike of last summer and stocks are bare, and with the existing demand and the promise of its continuance, are not likely to be full during the next few months at least. There is much delay in executing orders for steel and the car famine is increasing the difficulty of the situation.

Hollow Ware.—Prices in the Hollow Ware market are steadily maintaiued, but ou a level which is referred to by the manufacturers as uncomfortably low, notwithstanding the advances which took place during the last year.

Chain.—The Chain market is very firm, aud it ls thought by some that advances may be necessitated in the near future if the present condition of the market in raw material continues.

Rolled and Sheet Brass, &c.—Uuder date of January 2, 1902, the price of Rolled aud Sheet Brass and Bronzed Tubes underwent a reduction of 5 per cent. each; Brass Wire and Rods were lowered 7½ per cent. and Seamless Brass Tubes decliued 3 cents. The price of Brass Scrap is fixed at 9 cents net, of Low Brass Scrap at 10 cents and Bronze or Gilding Scrap at 11 cents per pound, all being subject to the usual terms. On account of the unsettled condition of the metal market these prices are subject to change without notice.

Seamless Brass and Copper Tubes.—The price of Seamless Brass and Copper Tubes on January 2, 1902, was reduced 3 cents per pound net. A new list on these goods will be issued within a short time.

Wire Nails.—The Wire Nail market has a somewhat firmer tone, as manufacturers are withdrawing some of the extremely low prices which have been current. The price which has been ruling has been uncomfortably low for outside manufacturers who have not the best facilities for producing goods at a minimum cost. The Wire Nail market in New York reflects the usual coudition of trade immediately after the first of the year. The demand from mills, however, is said to begin to show improvement, and contracts are being placed quite liberally for the spring trade.

Cut Nails.—There is a moderate demand for Cut Nails in the New York market. Representatives of mills are adhering to the price of $2.25 for Nails from store. Jobbers are making the same price gonerally, but in some instances are selling at 2 cents below these figures.

Wire.—The current demand for Plain Wire is heavy, and the output of tho mills is absorbed about as fast as made. The outlook for spring trade is excellent.

Sheet and Bolt Copper.—As noted in our last issue, the manufacturers of Sheet Copper, Copper Bottoms, Pits and Flats, &c., reduced the base price 3 cents to 18 cents per pound on January 2, 1902, in correspondence with the decline in the price of Ingot Copper. The following are the new net prices, as issued by the Ansonia Brass & Copper Company of New York, terms being cash:

PRICES OF SHEET COPPER.

Sizes of sheets.		64 oz. and over 50 lb. sheet, 30 x 60 and heavier.	32 oz. to 64 oz. 25 to 50 lb. sheet, 30 x 60.	24 oz. to 32 oz. 18¾ to 25 lb. sheet, 30 x 60.	16 oz. to 24 oz. 12½ to 18¾ lb. sheet, 30 x 60.	14 oz. and 15 oz. 11 to 12½ lb. sheet, 30 x 60.	12 oz. and 13 oz. 9½ to 11 lb. sheet, 30 x 60.	10 oz. and 11 oz. 7¾ to 9½ lb. sheet, 30 x 60.	8 oz and 9 oz. 6¼ to 7¾ lb. sheet, 30 x 60. Tinning.

Tinning Sheets on one side, 2½ cents per square foot.
For Tinning both sides, double the above price.
For Tinning the edges of sheets one or both sides, price shall be the same as for Tinning all of one side of the specified sheet.
For other sizes of Polished Copper add to price of Cold Rolled Copper.
Sheets 20 inches wide and under, per lb. 1c. | Sheets over 20 inches wide, per lb. 2c.
Planished Copper, 1 cent per pound more than Polished Copper.

Window Glass.—While the future status of Window Glass has not yet been determined, the local Glass market in New York is reported stronger than for some time, and jobbers are hopeful that the price war between manufacturers may be avoided. There is but little demand for Glass at the present time. Prices are unchanged.

White Lead.—Considerable competition is reported among manufacturers of White Lead in Oil, and prices are somewhat irregular. White Lead in Oil is quoted, in a retail way, at about 6½ cents per pound.

Building Papers.—There has been an average advance in Tarred Papers equivalent to about $2 a ton on Single Ply Tarred Roofing Felt and 5 cents a roll each on Two and Three Ply Tarred Felt. Prices seem to have advanced all over the country, although there are a few soft spots where competition is very keen. For the Eastern Trade the retail price of Single Ply Tarred Felt is $28 to $30 per ton; Two Ply, 50 to 55 cents per roll, and Three Ply, 75 to 80 cents per roll, delivered. The largest buyers at manufacturing points can shade these figures somewhat. Rosin Sized Sheathing, Deafening and Slaters' Felt and Water Proof Papers remain practically as they were, the prevailing weather exerting a deterrent effect on building.

Salt Glazed Sewer Pipe.—The Eastern and Western manufacturers of Vitrified Salt Glazed Sewer Pipe and Fittings adopted a new price-list December 19, 1901. There are several changes in the standard lists of Pipe, which are principally in the larger sizes. The lists have been adopted by all the manufacturers, we are advised, and the different makers have signified their intention of adhering to the schedule of discounts for the different territories. The list is as follows:

Price-List of Salt Glazed Sewer Pipe.

Adopted by Eastern and Western manufacturers, December 19, 1901.

Caliber of pipe.	Price per foot.	Elbows and curves 2 feet long or less, each.	Branches 1 foot and 2 feet long, each.	Branches 2½ feet long, each.	Slants per 1 foot or less, long side.	Running, P. S. and single H. traps, each.	Double hand hole traps, each.	Two-piece traps, per pair.
2 inches..	$0.16	$0.50	$0.72	....	....	1.50	....	....

30 inches..	5.50	27.50	....	27.50	...	....	....	....

Pipe of all sizes may be furnished with sockets or rings, and ring Pipe sold without rings may be sold at a discount of 10 per cent. from bill.

Increasers shall have socket on small end; Reducers, socket on large end; and shall be charged at double the price of 2 feet of Pipe, size of large end.

Each piece of Channel or Split Pipe shall be charged as three-fifths of a whole Pipe.

Stoppers or Plugs for closing Pipe, one-third of 1 foot of Pipe of the size in which it is used.

Fifty per cent. additional for Inlets 15 inches or larger on any size Pipe.

Branches 3 feet in length, add price of 2 feet of Pipe to price of 2-foot branch.

Each Inlet in addition to single branch shall be charged for at price that is added to straight Pipe for first Inlet.

SLOP AND CLOSET BOWLS, each, with or without Strainers.

12 x 6	$3.50
12 x 4	3.50
15 x 6	5.00
15 x 4	5.00

WELL TRAPS, each.

6-inch	$2.00
8-inch	3.30
9-inch	3.90
10-inch	4.70
12-inch	6.00

CELLAR TRAPS, each.

9 x 4, with bottom	$6.00	Without bottom	$5.00
12 x 4, with bottom	9.00	Without bottom	6.00

GREASE TRAPS, each.

8-inch, with bottom and cover	$6.00
10 " " "	7.50
12 " " "	10.00
15 " " "	15.00
18 " " "	20.00

BIRD CAGE WIND GUARDS, each.

6-inch	$2.50
7-inch	3.00
8-inch	3.60
10-inch	7.00
12-inch	10.00

MANDARY TOPS.

Same price as the Bird Cage Wind Guards.

WIND GUARD BONNETS, each.

5-inch	$1.40
6-inch	1.60
7-inch	2.00
8-inch	2.40

WALL COPING LIST, per foot.

8-inch and 9-inch	$0.35
12-inch and 13-inch	.55
18-inch	1.00

Corners, Angles and Closed Ends or Starters, each three times the price of 1 foot of straight Coping.

From the above list a series of discounts are made for the six different districts into which the country is divided, as follows:

DISTRICT No. 1.—New England.
DISTRICT No. 2.—New York and New Jersey.
DISTRICT No. 3.—Maryland, Delaware and District of Columbia and Pennsylvania east from a line on the eastern boundary lines of McKean, Cameron, Clearfield, Cambria and Somerset counties.
DISTRICT No. 4.—Pennsylvania west of a line on the eastern boundary line of McKean, Cameron, Clearfield, Cambria and Somerset counties, and West Virginia.
DISTRICT No. 5.—Ohio, Michigan and Kentucky.
DISTRICT No. 6.—Virginia.

The discount sheet, with other information relating to District No. 1, is as follows:

DISTRICT NO. 1.—DISCOUNTS IN EFFECT DECEMBER 19, 1901.—NEW ENGLAND.

	Per cent.
Standard Pipe, 2-inch to 24-inch	70
Double Strength, 15-inch	65
Double Strength, 18-inch, 20-inch, 24-inch	61
Standard Pipe, 27-inch and 30-inch	60
Double Strength, 27-inch and 30-inch	52

All Pipe in 2½-foot and 3-foot lengths to take 2 per cent. less discount than above, except 27-inch and larger sizes usually made in 2½-foot lengths.

Deep and wide sockets on either Standard or Double Strength Pipe to take 3 per cent. less discount than specified for the various sizes and kinds of Pipe.

Second quality Pipe, 5 per cent. greater discount than same sizes of first quality Standard Pipe.

The discount on Pipe sold for contract work, with breakage and inspection guaranteed, shall be 3 per cent. less than when sold without such guarantee.

Flue Lining, 2½ per cent. greater discount than foregoing prices on first quality Standard Pipe.

Stove Pipe and Thimbles, same discounts as first quality Standard Pipe.

Chimney Tops, 10 per cent. less discount than first quality Standard Pipe.

Wall Coping, same discount as first quality Standard Pipe.

Freight allowed on car lots, except that to points where the rate exceeds 25 cents per 100 pounds from Akron, Ohio, the price should be increased sufficiently to cover the extra cost of freight, figuring that 1 per cent. of the list equals 2 cents per 100 pounds additional freight on Standard Pipe; 2 per cent. of the list equals 3 cents per 100 pounds additional freight for Double Strength Pipe.

Breakage, if any, at risk of purchaser. Terms of payment: 60 days, or 2 per cent. off net bills after deduction of freight for cash within 15 days from date of invoice.

The remaining territory is subject to somewhat larger discounts with slight modifications in the freight allowances on car lots, varying with the district, and on Pipe sold for contract work the amount of the discount increasing as the freight rate decreases. For instance, in District No. 2, New York and New Jersey, the discount on Standard Pipe, 2 to 24 inches, is 73 per cent. In District No. 3, Maryland, &c., the same goods are subject to 75 per cent. discount, with corresponding changes in Double Strength and Standard Pipe of the various dimensions. Freight allowances, &c., also vary with the different districts.

The Dealer who buys the White Mountain Freezer

is the dealer with a bank account.

He buys on the strength of established reputation and acknowledged worth.

He buys the right goods at the right price and sells them right.

He is the dealer to whom we want to sell and to whom we do sell.

He buys **The White Mountain Freezer** because he recognizes its merits and appreciates its possibilities as a trade and money maker.

He knows that each year the sale of **White Mountain Freezers** has increased; that it is now and has been for years the leading ice cream freezer of the world.

If you're not now selling **White Mountain Freezers,** we'd like you to begin this year. We'd like you to have our new catalogue, anyway. It is the most complete and attractive freezer catalogue extant. Write for it to-day.

The White Mountain Freezer Co.,
NASHUA, NEW HAMPSHIRE.

WASHING MACHINES

NICKEL-STEEL-WARE

Patented Feb. 12, 1895.

COST	SELL

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.
We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.
The enamel coating is homogeneous, of extra thickness, and great purity.
It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.
Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

{ Pierre de P. Ricketts, E.M., Ph.D.

Analysis No. 14,180. NEW YORK, May 5, 1897.
LALANCE & GROSJEAN MFG. CO.:
GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.
We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,
RICKETTS & BANKS,

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION

A USEFUL hand book for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 — Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 — Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder a cone, and other information relating to the work of a tinsmith.

Section 3 — Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

GENERAL OFFICES:

Battery Park Building, NEW YORK CITY.

POLYGON

CONDUCTOR PIPE.

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free Address

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

WHAT THIS "BERGER'S Classik" METAL CEILINGS MARK MEANS

It means Merit, Originality, Exclusiveness and Adaptability in Metal Ceilings.

"What's in a name? The Bard of Avon asks,
Haply unmindful of life's lowlier tasks,
A name fraught with power almost divine,
And lesser ones are all eclipsed by them."

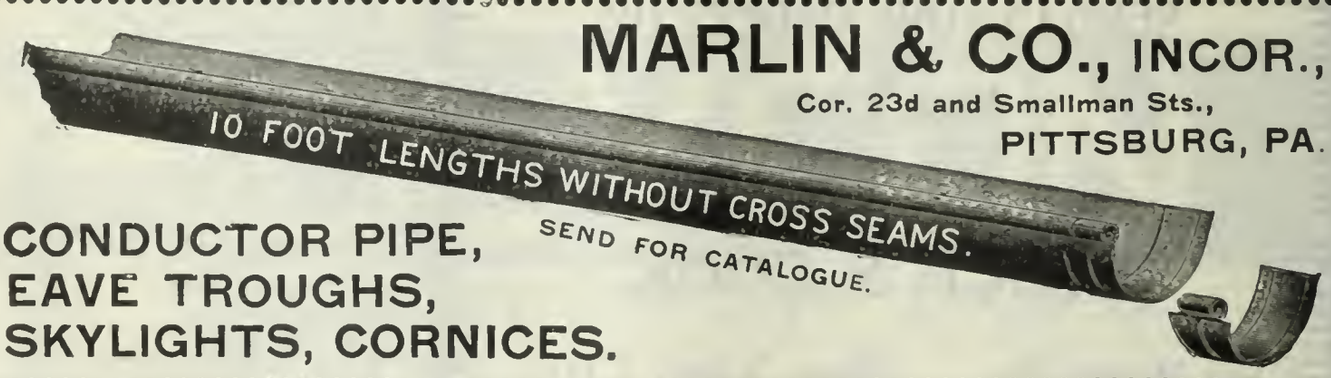
We took an advance position when we originated and put into practice the idea of producing metal ceilings in complete "CLASSIFIED" designs of famous artistic styles.

This advance position we have been holding ever since, and in keeping with the character of our goods we have adopted for them the above distinctive and appropriate name of "CLASSIK" Metal Ceilings.

As a matter of course the trade appreciates their value and superiority. Even competing manufacturers recognize the advantages of Berger's "CLASSIK" Ceilings (although, of course, they can't be expected to admit it).

We grasped the idea placing Metal Ceilings on a correct artistic basis—we bought out a series of Complete Classified Designs ("Berger's Classik" we have named them) and they took the lead.

In artistic harmony, character of stamping and variety of patterns offered they set the pace that others would like to follow.



For up to-date ceilings come to us.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

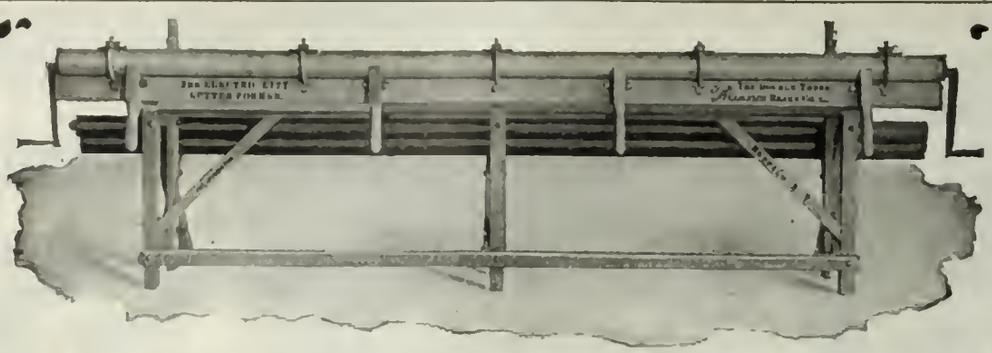
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

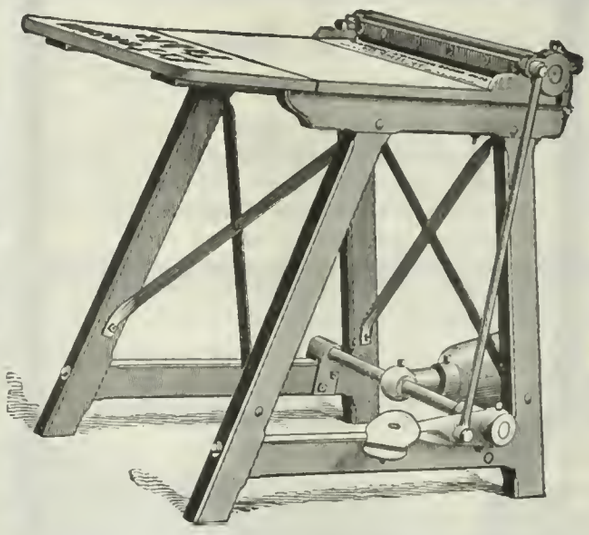
New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.
This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.
The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.
Ask us about it. We gladly furnish information and price on request.



THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

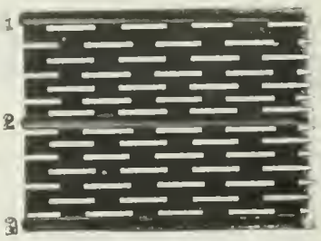
DANZER'S LIGHTNING EDGER.

PAT. NOV. 26, 1901.

Built in two sizes, 21 and 31 inches wide. Built for hand, foot and belt power.

It will edge 28 iron and tin for roll or flat seam roofing.

The cheapest, simplest and quickest edger on the market. Will edge from ¼ to ⅝ inch wide, and has edged a box of 20 by 28 tin in six and three-quarters minutes.



It is a time, labor and money saver.

SHOWING DOVETAIL KEYS.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

PRICE, - - $35.00.

COMPARISON *is* TEST.

WE want you to test a "DIGHTON" now—set it to heat the north end apartment of a block of houses and compare fuel consumption with whatever Furnaces may be used in the others.

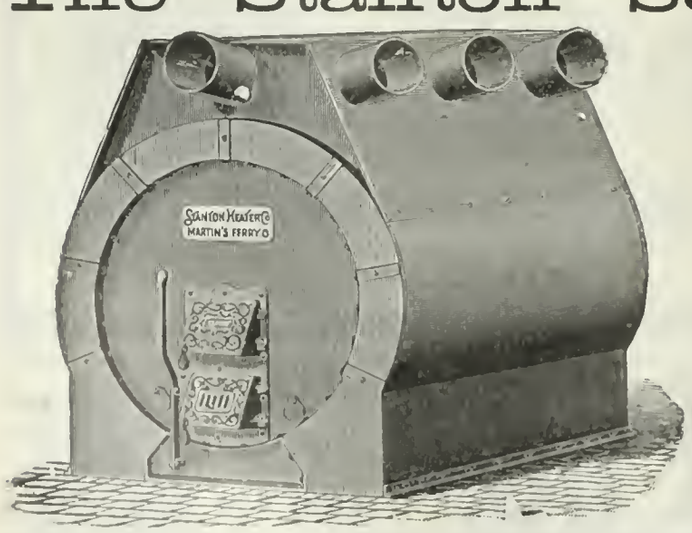
If the owner or architect has specified some other name because of extensive advertising or for any other equally "valuable" reason, tell him to give you an opportunity to prove the "DIGHTON" the most economical and satisfactory Furnace ever built.

We can tell you of a dealer that sets a good many different makes. He now sets 12 "DIGHTONS" to one of any other make, having proved to his own and several customers' satisfaction that the "DIGHTON" is the best.

Another dealer took out a 24 inch pot—that had been used three years (had never given satisfaction); a 24 inch pot "DIGHTON" set in place of it heats every room perfectly, with less fuel, and no change of any kind was made in the piping or cold air duct.

If you've got or can make an opportunity to test a "DIGHTON" where conditions allow of comparison, *do it*, and do it *now*. We'll sell you more "DIGHTONS" in 1902 than you sold of all other kinds together in 1901.

DIGHTON FURNACE CO., Taunton, Mass.



Your Guarantee is Good,

If backed up by our line. We make many kinds and sizes of steam and hot water boilers, and you as a dealer ought to know all about this line. Let us send you our printed matter and post you on the standard line. Write to-day.

MANUFACTURED BY

R. J. SCHWAB & SONS CO., = Milwaukee, Wis.

They regulate heat in residences, offices, stores, mfg. plants. Guaranteed.

The Howard Thermostat Co.

West Water Street, Oswego, N. Y.

No electricity or compressed air Simple as a heavy spring motor can be.

Would like to send you their catalogue and give a few reasons why you should sell their Heat, Valve, Draft and Damper Regulators. This should be an interesting topic. We have the most simple thermostat made; also the most sensitive. Only three parts—a sensitive and powerful sensitive plate, a heavy spring motor made of brass and common pulley connections Just enough material to do the work satisfactorily, but not one atom too much. They do "straight work," without the aid of outside agencies. No other thermostat on the market can do more with all of its electricity and compressed air connections.

THEY SAVE THE COAL

WHICH IS WASTED BY THE WRONG OPERATION OF FURNACE OR BOILER DAMPERS.

TEN BELOW ZERO DOES NOT BOTHER THE

RICHMOND HEATER.

IT IS EFFECTIVE IN ALL KINDS OF WEATHER. POWERFUL, ECONOMICAL, EASY TO REGULATE, DURABLE.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

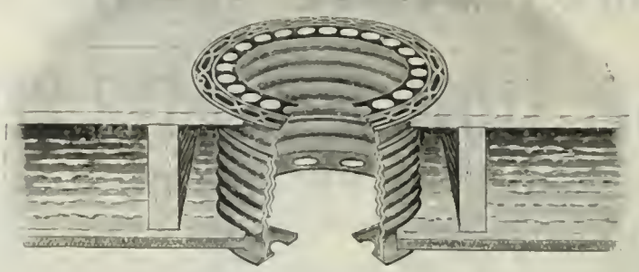
Chapter VI.—Heating of Public Buildings. Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Pan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.



APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

SENT, POSTPAID, ON RECEIPT OF PRICE, $1.50

Kitchen Boiler Connections

A New and Enlarged Edition.

The attention of readers of The Metal Worker is directed to the *fifth and enlarged edition* of Kitchen Boiler Connections, just published. Four editions of this practical book have been sold, giving apparently universal satisfaction, but with a view to presenting a more thorough treatise on the subject, and to enhance the value of the book to the Plumber, Architect and Mechanic, we have incorporated with this edition about sixty-five pages of new matter, together with over forty additional illustrations.

A Selection of Practical Letters and Articles Relating to Water Backs and Range Boilers . . . . .

These additions cover many important phases of the subject not discussed in the earlier editions, giving practical solutions of numerous other problems often met with.

The new contents include among other important subjects:

In Chapter	I.	Kitchen Boiler Below Range.
"	VI.	Water Hammer in Boiler Connections.
"	VIII.	Proper Connection for a Horizontal Boiler.
"	VIII.	Double Water Back Instead of Double Boiler.
"	VIII.	Two Horizontal Boilers Connected with One Water Back.
"	IX.	Supplying Hot Water in Large Buildings.
"	X.	Lime Deposit.
"	XII.	Hot Water Supply and Heating a Barn.

Examples from actual practice only and which have arisen in the daily work of plumbers and pipe fitters are given in this book, which is therefore practical from beginning to end. Every mechanic, whether expert or novice, should have on hand for constant use or for reference a copy of this the new fifth enlarged edition.

It tells How to Connect Kitchen Boilers and Water Backs Under All Conditions.
It explains Remedies to apply to all kinds of Difficult Cases.
Heating from Kitchen Boilers is fully described.

194 Pages. Size 6 x 9 Inches. 113 Illustrations. Cloth Bound.

Price One Dollar, Postpaid.

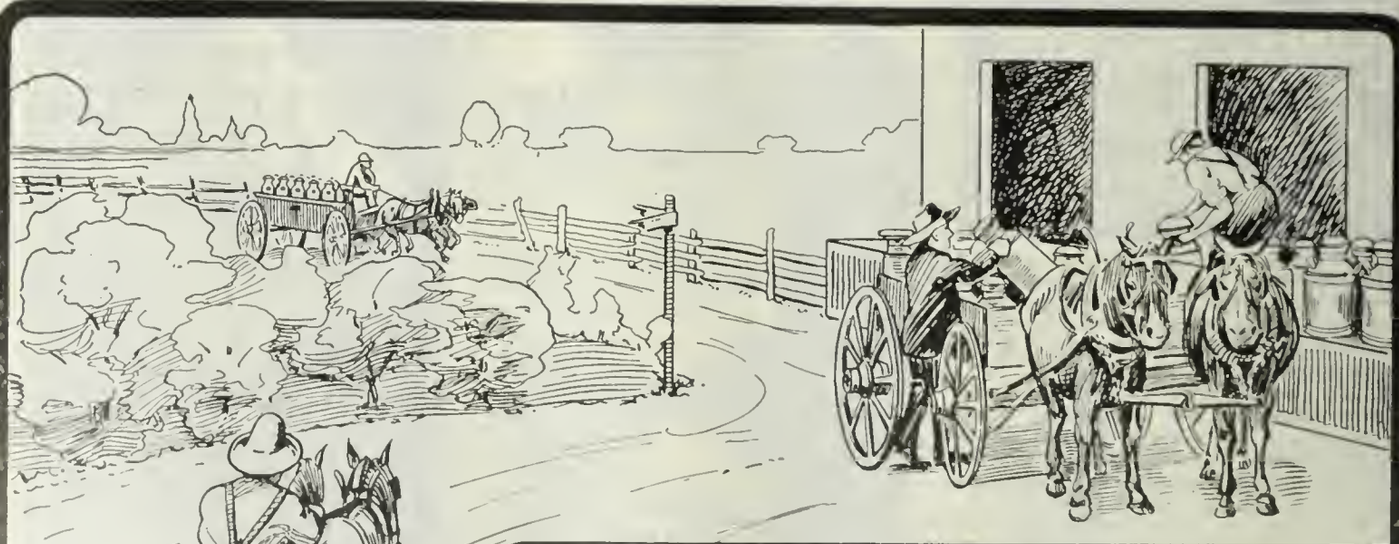
The Kelsey Warm Air Generators

Are constructed on the principle of warming the air by bringing it into direct contact with an extensive and properly heated surface.



By sending the air in separate channels ***through the cast iron sections*** which are in direct contact with and over the fire, it is more thoroughly and evenly warmed, than by simply passing over or next to a hot surface.

Send for booklet "Kelsey Heating."

Decline in Pig Iron Production

According to the monthly blast furnace statistics of *The Iron Age*, the furnace capacity of the country in active operation on January 1 reflected to some extent the troubles which beset the managers during the last two months of the past year. The furnaces entered the new year with a capacity of 298,460 tons per week, as against 324,761 tons on December 1, 1901, while stocks of pig iron showed a decrease of only about 6500 tons for the month. This small decrease is due to the fact that while many furnaces reduced the amount on hand, others accumulated iron, because they could not ship it as fast as wanted owing to the lack of transportation facilities. Quite a number of stacks were blown out in December and others were banked again and again. The disturbance created by the inability of the railroads to handle the business offered to them lessened the output of pig iron last month considerably, and was the only reason for decline in the output of the furnaces. Had it not been for this obstacle there is every reason to suppose that the productive capacity of pig iron on January 1 would have shown an increase over that of December 1, as the consumptive demand has been and still is very heavy. The Pittsburgh and the Chicago districts were the principal sufferers from the coke shortage. This condition, however, begins to show signs of betterment, and it is likely that the January product, should the improvement continue, will be larger than the status of the furnaces at the beginning of the month would indicate. The pig iron market continues strong and the consumptive demand is very active, especially in foundry irons, which have stiffened in price from 25 to 50 cents per ton during the week. The outlook in this branch of trade gives every indication of continued activity and strong prices, at least for the first half of the year.

Minute Economies.

It has been for years the aim of manufacturers to avail themselves of the benefit of the most minute economies in the production of their goods. This has been forced upon them by the stress of competition, as in the long run success belongs to those who can turn out a given product at a minimum price. The application of this principle of economy in production is to a great extent the secret of the invention and enterprise which are so characteristic of this country, and which have so much to do with its manufacturing supremacy. The representative American manufacturer is constantly endeavoring to effect a saving somewhere. Not only machinery and inventions which effect important economies are sought for, but there is an unceasing effort to avoid unnecessary expense in any department of the business.

The same principle is applicable to mercantile business, in which the expense account is constantly to be reckoned with. Its tendency to grow and absorb the profits is one of the features of business. Enterprise, which is essential to success, usually involves outlay, which must notwithstanding be kept strictly within bounds. In connection with the repression of unprofitable expenditure there must be a close scrutiny of all the details of the business with a view to eliminating any outlay which does not justify itself, and also to diminish the expense in every department, so that the business may be carried on at as low a cost as possible. There is little doubt that this is a lesson which merchants need to learn. In this respect the manufacturers are far in advance of them. The scrutiny of cost is much more rigid in the making than in the selling of goods. This is true in a good degree of many of the large houses, but the remark is still more applicable to the smaller houses. One of the good results of the associations which have been taking so prominent a place in the hardware trade is the success with which they direct the attention of the members to the necessity there is for good business methods in this and many other matters. The tendency should be toward saving wherever it can be effected.

Profits in Manufacturing.

It would naturally occur to one at first blush that the greatest profit in the manufacture of hardware would be in lines that are complex in their nature and that require special talent and equipment for their production; yet, outside of patented articles, such does not seem to be the case. The principal difficulty appears to be that in lines of this nature the demand is comparatively limited, and that consequently the question of tonnage as affecting cheapness of manufacture cannot be considered. On the other hand, the proportion of profit is limited by the fact that the price of such articles largely determines their use, as too high a price interferes seriously with the demand. Against this is the further limitation that such goods are necessarily costly to produce, because of special facilities, expensive machinery and high-priced labor, so that the percentage of profit is not great, considering the limited output, uncertainty of demand and the further limitation as to selling prices.

The manufacture of very staple goods is often regarded as less than promising, yet as a rule they have represented the largest volume of profit. It is true that almost any one can make them, that the margin of profit is small, that competition is severe, and that the goods are sold largely on their price, there rarely being anything specially distinctive in any one make. Yet it is equally true, and herein seems to lie the advantage, that the goods are made economically with cheap labor as a rule, and largely by machinery, that they can be moved in large quantities, and that there is always a demand for them. Success in such goods seems to be partly a

matter of location and largely a matter of executive ability. It is certain that the great fortunes in the manufacture of hardware have been made principally along these lines.

On the other hand, it is undoubtedly true that the manufacturer of special goods of minor importance has often been rewarded with success in building up a profitable business, which, while not always giving a great fortune, has yielded a reasonable competence. Many illustrations of this will occur to the trade where articles outside of the great staples have made for themselves a position in the market, while their manufacture has been attended with substantial profits. Such lines are frequently protected by patents and thus the manufacturer secured in his control of the invention, which, if of merit and successfully placed on the market, may bring in a very satisfactory, and in some cases an ample, income. There are also many instances in which goods of this character make for themselves a permanent place in the favor of the trade because of their superior quality. Many illustrations of the great value of a trade-mark will occur to our readers, even in these days when low price has so much to do with the marketing of commodities. One great advantage connected with the manufacture of specialties as contrasted with staple goods is that an opportunity is afforded for their manufacture on a smaller scale, thus giving parties with less capital a foothold in the market.

Another unintended compliment to American petroleum has been paid by European interests. We noted not long ago that American oil had been barred from use by the Metropolitan District Railroad of London, except for signal lamps and lanterns, where the smokelessness of the American product made its use essential. Now it is further reported that the railroad management in Cassel, Germany, has also ordered that American oil be used only for office lamps and signal lanterns, and that the Russian petroleum is to be used for all other purposes. This is a pretty clear recognition of the superiority of the American oil over the Russian.

The Senate Committee of Commerce last week reported favorably Senator Nelson's bill for the creation of an executive department of the Government, to be known as the Department of Commerce, which provides for a new cabinet officer, to be known as the Secretary of Commerce, together with a complete staff of secretaries and officials. Under the new department it is proposed to include the Life Saving Service, Light House Board, Marine Hospital Service, Bureau of Navigation and United States Shipping Commissioners, Steamboat Inspection Service, Bureau of Immigration, Bureau of Statistics, United States Coast and Geodetic Survey, the Railroads Commission, Census Office, Patent Office, Department of Labor and Bureau of Foreign Commerce, now in the State Department. A Bureau of Manufactures and a Bureau of Mines and Mining are also established. The new department is designated to promote commerce and furnish all information bearing upon commerce and industry, thus relieving the Treasury Department of a vast amount of work, much of which is of an extraneous nature, now performed by that department.

The directorate of the South Carolina Interstate and West Indian Exposition, now open at Charleston, S. C., announce that there is yet some available space for exhibits in several of the buildings, and that a few lines of manufacture are not so far represented at all. They therefore invite exhibitors to take advantage of the favorable opportunity to advertise their goods at this exposition. The exposition, they say, will not be fully completed or at its best before the middle or latter part of this month, and the largest attendance will be from February to May, when the Florida travel will increase it. The generous plan and scope of the exposition is not fully realized by the public at large. Its buildings are larger than those of the exposition at Omaha, Atlanta or Nashville, and the floor space in many of them equals the Pan-American. The managers believe that this exposition offers an unusually favorable opportunity for the reaping of good results by exhibitors.

Testimony as to the value of the consular reports printed by the State Department for the information of the merchants and manufacturers of the United States is constantly being rendered, and shows that these reports are very widely read. A recent communication from United States Consul Grout of Malta bearing upon this subject is of interest. Mr. Grout expresses surprise at the wide popularity given to the consular reports, and mentions that some months ago he sent a report upon refrigerators, since which time he has received newspaper clippings referring to this report, not only from the United States, but also from England, France, Germany, Switzerland and Austria. In the above mentioned report Mr. Grout gave the addresses of the parties in his consular district likely to be interested in refrigerators. As a result the desks of the merchants named were covered with refrigerator catalogues in various languages.

Doing Business in the Persian Desert.

British commercial missionaries certainly penetrate to the uttermost parts of the earth. Not, possibly, with a rifle in one hand and a Bible in the other, but, as in the case under notice, with tea in both hands. One of these indefatigable persons has recently proselyted in Southern Persia, and a most interesting narrative of some of his happenings is published at length in the Journal of the Society of Arts. Even in the desert he pursued his avocations and endeavored to obtain orders from individuals with names indigenous, such as Seith Suleyman and Mohammed Ali Brothers and others. These sons of the soil were by no means averse to trading, and were exceedingly well posted up on prices, so if the English missionary intended to treble them, as the natives did in hiring him camels, he made an error, and was forced to drop to the list and discounts on the start, if he meant to do any business. In the desert shops the traveler found most amazing stocks of goods; to wit, white duck, all sorts of cotton prints, canned goods, grenadine, plush, sparklets, boots, ladies' shoes, lamps, chandeliers, lithographed pictures, scent bottles, mats, cigarettes, carpets, stationery of all kinds, medicines, clocks, glassware, tea pots, furniture, padlocks, hat racks (in a land of turbans!), fancy match boxes and jewelry. The traveler told the merchant that he could not see where he got his trade from, which was a little impertinent, but the trader said that customers were plenty, and he got his money back. The British banking system is in force, and it is not at all difficult to obtain funds at almost any point along the routes of the caravans. The Persian Government collects duties upon all goods entering their country to the amount of 5 per cent., taxing the cost of carriage as well as the invoices! So it appears that the "heathen Chinee" is not the only one who has "tricks that are vain and ways that are peculiar." Every fourth or fifth shop in the desert is a tea shop, and the general preferment is for Chinese teas, as against the more expensive Ceylon and India teas; an enormous quantity in the aggregate is sold. Deliveries of orders are somewhat slow at present, but this will be remedied in the near future by railway lines now in course of construction by both the Russian and German Governments.

The net earnings of the United States Steel Corporation in the nine months ending December 21, 1901, are officially reported to have been $84,779,298, or a monthly average of nearly $9,500,000. The sum of $11,400,000 was paid in interest on bonds for the nine months and $42,005,807 was paid out in dividends, the balance available for surplus amounting to $19,444,497.

The Gasoline, Oil and Gas Stove Consolidation.

We recorded in our last issue the organization of the American Stove Company, with an authorized capital of $5,000,000. The new corporation includes the following nine concerns, constituting most of the leading manufacturers of gasoline and oil stoves and gas stoves and appliances:

Ringen Stove Company, St. Louis.
Quick Meal Stove Company, St. Louis.
George M. Clark & Co., Chicago.
Schneider & Trenkamp Company, Cleveland.
Standard Lighting Company, Cleveland.
Dangler Stove & Mfg. Company, Cleveland.
National Vapor Stove & Mfg. Company, Lorain, Ohio.
Monarch Stove & Mfg. Company, Mansfield, Ohio.
Twin Burner Vapor Stove Company, St. Louis.

It had been known for many months that negotiations were proceeding for the consolidation of these interests into one company, but obstacles of various kinds were encountered from time to time, and it would frequently appear as though it was impossible to adopt a plan on which all could be brought together. The announcement of the consummation of the scheme, therefore, comes as a surprise to the vapor, oil and gas stove trade. The negotiations were completed the past week under the direction of Ritcher, Montgomery & Hart, lawyers, of Chicago, and the company began business on January 6.

The new company will include, as above stated, the leading companies engaged in the manufacture of vapor, oil and gas stoves. This consolidation, however, will not be a monopoly, as several good sized manufacturing establishments engaged in the production of vapor stoves will continue to operate independently. In the oil stove business are also to be found some important independent manufacturers. The gas stove trade presents a still wider field, as the manufacturers in this line are much more numerous, including quite a large number of manufacturers of coal stoves who are also engaged in the production of gas stoves and ranges. The purpose of the new company, therefore, is not to endeavor to monopolize any branch of the stove trade, but to secure economies in the marketing and delivery of their products which will enable those interested in the company to secure better returns on their investment. They have for a long time been suffering from competition with one another in the cheaper classes of stoves, which are used most extensively. The prices of such stoves have been frequently down to cost or even below it, and it is expected that hereafter a basis of better prices can be maintained.

The new company will also be an important factor in the steel trade, as several of the constituent companies have been prominent in the manufacture of steel ranges and will continue to produce this class of goods. All the constituent companies have transferred their entire properties to the American Stove Company, including their steel range business.

The officers of the American Stove Company are as follows:

President, C. A. Stockstrom, St. Louis.
First vice-president, George M. Clark, Chicago.
Second vice-president, D. A. Dangler, Cleveland.
Third vice-president, F. L. Alcott, Cleveland.
Secretary, H. J. Trenkamp, Cleveland.
Treasurer, George F. Fiske, Chicago.

The Executive Committee is composed as follows:

C. A. Stockstrom, St. Louis.
F. L. Alcott, Cleveland.
George M. Clark, Chicago.
H. J. Trenkamp, Cleveland.
D. A. Dangler, Cleveland.
E. H. Stockstrom, St. Louis.
Geo. F. Fiske, Chicago.

The Board of Directors is as follows:

C. A. Stockstrom, St. Louis.
John Ringen, St. Louis.
Louis Stockstrom, St. Louis.
E. H. Stockstrom, St. Louis.
George M. Clark, Chicago.
George F. Fiske, Chicago.
Paul Schneider, Cleveland.
Henry Trenkamp, Cleveland.
H. J. Trenkamp, Cleveland.
F. L. Alcott, Cleveland.
W. H. Boardman, Cleveland.
D. A. Dangler, Cleveland.
D. E. Dangler, Cleveland.
O. P. Moon, Lorain, Ohio.
E. C. Baxter, Mansfield, Ohio.
A. E. Ambs, St. Louis.

The main office of the company will be located at St. Louis, but offices will also be maintained at Chicago and Cleveland. All plants of the constituent companies will continue to be managed as heretofore by their own officers, and the stove trade will, therefore, practically observe no change in their relations with the establishments by whom they have heretofore been supplied. All contracts taken before the consummation of the consolidation will be filled strictly according to the terms of such contracts.

F. L. Alcott as general manager and O. P. Moon as assistant manager will have charge of the five plants in the Cleveland division. The Harvey, Ill., plant will be in charge of George M. Clark, and those in St. Louis will be managed by Louis Stockstrom and A. E. Ambs. The same force of salesmen, with some addition to their ranks, will represent the several houses on the road.

The American Stove Company will start out with a bonded indebtedness of $750,000, the bonds being in denominations of $1000, bearing 5 per cent. interest, and with a working capital of upward of $1,200,000. The bond issue is based on a deed of trust, covering the properties of the constituent companies, taken by the Equitable Trust Company of Chicago, the bonds being made payable at the Lincoln Trust Company, St. Louis. These bonds are redeemable in blocks of 50, beginning July 1, 1903, and in the same month every year up to 1917. All the stock of the company and the entire issue of bonds are held by persons interested in the new company, and it is stated that none of the stock or bonds will be placed on the market. It is further stated that the earnings for 1901 of the plants acquired were sufficient to meet all fixed charges, pay a 6 per cent. dividend upon the capital stock of the new company and leave a surplus of $50,000 for the retirement of bonds.

NEW YORK STATE STOVE MEN ADVANCE PRICES.

A meeting of the Western New York and Northern Pennsylvania Stove Manufacturers' Association was held at the Waldorf-Astoria Hotel in New York City on Wednesday, January 15, when a full discussion of the various conditions existing in the trade was held and an advance of 5 per cent. in the price of stoves was decided upon. It was the general impression that there had been no remuneration to the manufacturer in the prices ruling on oak stoves, and it is probable that these goods will be subjected to further advances.

THE ASTOR HOUSE STOVE ASSOCIATION.

Now that an advance in the price of stoves has been made by the New York State manufacturers and the Pennsylvania manufacturers, and promised by the Pittsburgh manufacturers, and that some of the contentions in the Philadelphia market have been settled under a new agreement, there is strong evidence that the stove manufacturers feel that advances in prices were necessary to the conduct of their business at a profit. The only associations which have not already taken a step in this direction are the New England Association, which has the matter under consideration, and the New York Association, which formerly met at the Astor House. Evidently there is a feeling that if the manufacturers in any section fail to keep step with their colleagues, the influence is likely to be detrimental to the interests of all.

It is probable, in view of these facts, that Secretary Thomas J. Hogan of the National Association of Stove Manufacturers, who spent some time in New York City this week, consulted with the members of the local association on the advisability of either reviving the old

association or reorganizing it on a new basis. There is a strong hope that success will attend his efforts, now that some of the dissenting members have reached an agreement and adjusted their differences. Some of the old members are strongly of the opinion that, whatever else is done, the association should secure the services of an official who will give his entire time to its interests. This experiment is said to have proved very satisfactory to the large membership of the Pennsylvania Association. It seems perfectly clear that whatever is done should be done quickly before any orders are booked for the year. The right man in such an official position would prove invaluable if he could encourage the members to hold throughout the year to the prices which they agree upon early in the season.

Banquet to Stove Salesmen.

Brief reference was made in these columns last week to the annual conference of salesmen and agents of the Reading Stove Company, which was held at the home office in Reading, Pa., and to the banquet which was given to the representatives of the company at the Mansion House. The latter feature was the occasion for the expression of much good will and friendly feeling, and will long be remembered by the participants. The banquet hall was tastefully decorated and the following *menu* served:

Blue Points.
Celery. Tomato Soup.
Lobster à la Newburgh.
Green Peas.
Young Turkey Stuffed. Cranberries.
Braised Sweetbreads. Potatoes.
Lettuce with Mayonaise.
Vanilla Ice Cream. Fancy Cakes. Cheese.
Crackers. Coffee.
Cigars.

President W. Harry Orr presided and welcomed the party, after which Mr. Essick took his place as toastmaster. A dozen of the banqueters made responses and the brightest prospects for the new year were predicted. The guests were:

Directors: W. Harry Orr, president; Edgar Amole, treasurer; C. H. Williamson, superintendent; W. H. Luden, Jesse Posey, R. P. Shick and C. H. Shick.

Main Office: Wm. S. Essick, secretary and general manager; F. L. Connard, manager heating department; J. C. H. Lynn, chief clerk; Daniel Amole, foreman shipping department.

Reading Salesmen: Jos. W. Sheeler, C. C. Hornung, W. H. Kurtz, C. A. Barker, F. Ruoff, F. C. Steltz, T. W. Fagan and W. H. Shick.

Boston Branch: Walter H. Billings, manager; Alex. C. Burke, salesman.

Philadelphia Branch: Wm. Thomson, manager; A. J. Eickmeyer, W. H. Clark and George E. Eben, salesmen.

Chicago Branch: John H. Ross and John Kontny, managers.

Reading Foundries: Nathan Gates, James Gossler, John A. Kline, Richard Riddington, C. W. Irwin, W. H. Rhoda, Horace Grander, E. S. Miller, W. A. Deeter, E. C. Auman and Bertram Shaner.

Dayton Foundry: Zenas A. Craig, superintendent, and W. M. Kingsbury, salesman.

Guest: Harvey J. Fueller, statistical reporter.

The Abram Cox Stove Company.

The Western branch of the Abram Cox Stove Company, under the management of Charles A. Rusco, whose headquarters are at 19 West Lake street, Chicago, has enjoyed an unusually prosperous year. The territory covered by this branch is larger than that under the control of any of the Western branches of the other large stove companies. It includes Ohio and every State west of it. Since taking charge of this branch Mr. Rusco has greatly enlarged the Western business of the company. He shipped out from February 1 to August 30 $61,000 worth of stoves more than in the best 12 months he ever had with the company he formerly represented. Under his management Novelty stoves have gained such a strong hold on Western trade that numerous voluntary testimonials have been received from stove dealers in every section covered, expressing their pleasure with the manner in which these goods have found favor with their customers. The only disappointment during the year arose from the fact that dealers were not able to get all the stoves they wanted. The condition of business during the hight of the season is indicated by the fact that with the exception of a few days early in the month not a single salesman was on the road in September, simply because the sales had at that time exceeded the ability of the company to make shipments. More stoves were sold in the first six months of the year than the Western branch had expected to sell the entire year. The furnace trade also showed a heavy increase.

Arrangements are now under way which will greatly increase the supply of Novelty stoves for the coming year. The company are building a new foundry and warehouse at their works at Landsdale, Pa., and increasing the size of their mounting department. The molding room of the new foundry will be 150 x 250 feet in size, and after it is completed the company will employ as many molders as any stove company in the United States. The building used for mounting purposes, which is now two stories high, will have a third story, and its length will also be extended, thus giving it much greater capacity. The heavy Western trade has added so greatly to the business of the company that the foundries have been able to run on full time during the whole of 1901. The enlargement made, it is hoped, will enable the company to take care of all orders this year as rapidly as they are received.

Preparations are now being made to do twice the Western business done in 1901, and if the demand exceeds this the company will make still further enlargements to meet the requirements of the trade in 1903. Arrangements have been made to bring out three new lines of base heaters for the coming season. The line of cast ranges will also be enlarged by the addition of three new sizes.

The Western branch will be represented this year by the following traveling force: Warren W. Rusco and W. W. Barrick in Chicago and suburbs, O. C. Harrison in Wisconsin and the Northern peninsula of Michigan, T. M. Gilfillan in Minnesota, North Dakota and South Dakota; C. H. Parmelee in Washington, Montana and Idaho; L. A. Munn in Iowa, Walter M. Hogan in Illinois and Southern Michigan, W. F. Garretson in Indiana and Ohio, Howard Reed in Kansas and Oklahoma, and Lewis H. Painter in Nebraska and Colorado. Most of the force named have been with Mr. Rusco for the past six or eight years, and have therefore thoroughly demonstrated their qualities as salesmen. In recognition of the services rendered during the year he made every salesman a Christmas present of a valuable English silk umbrella of the finest character.

Hemp & Co.'s New Quarters.

Hemp & Co., manufacturers of air tight heaters and patent stove pipe, also makers of special goods for the trade, have now permanently located in their new factory at Second street and Chouteau avenue, St. Louis, Mo., which is equipped with new and up to date machinery and possesses a greatly enlarged capacity. On July 23 last, it will be remembered, this firm had the misfortune to lose by fire their entire plant, all goods made up ready for shipment and all machinery and material on hand, the only things saved being their account books and files. They secured temporary factory quarters at the St. Louis Stamping Company's building on Main street and Cass avenue, purchased new machinery and materials, and immediately started up to fill the requirements of old contracts, but refusing all new business. We are glad to announce to the trade that they are now housed in brand new buildings on the old site, the main building being 110 feet front, 211 feet deep and three stories in hight. In order to guard against a recurrence of a fire they have put up a separate building on the opposite side of the street for their japanning and enameling departments.

The Kelsey Heating Company, Syracuse, N. Y., are sending out with a card bearing the inscription "With Best Wishes for 1902" a vest pocket memorandum book in white celluloid covers giving their address and calling attention to the Kelsey Warm Air Generator. *Fac-similes* are given of the medals of highest award received by the company at the Pan-American Exposition.

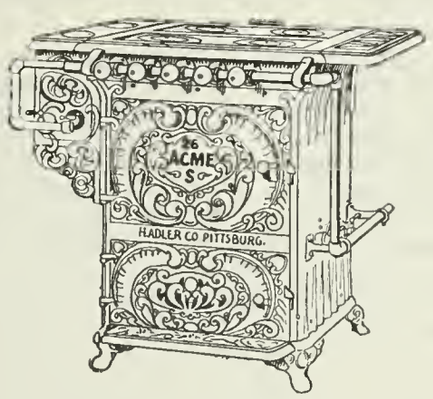
Henry Cribben.

Henry Cribben of Chicago is now believed to be the oldest practical stove manufacturer connected with the trade. Mr. Cribben has been engaged in this line as molder and manufacturer for the long perlod of 51 years. He is still regularly to be found in the office of the Cribben & Sexton Company, taking an active interest in the affairs of that company. Mr. Cribben is enjoying vigorous health, and bids fair to continue many years more ln harness. He has achleved the distinction of having been the most successful of all the members of the stove trade connected with the development of the industry at Chicago. His connection with the Chicago stove trade dates from 1873, when he located in that city as the Western representative of the Co-operative Foundry Company of Rochester, N. Y., of which company he was president. He then purchased the company's Chicago stock of stoves, and forming a partnership with the late James A. Sexton, established a stove jobbing house. In 1878 they built a small foundry on part of the ground now occupied by the extensive works of the Cribben & Sexton Company and began to manufacture. Mr. Cribben's career covers many vicissitudes in the stove business as well as stirring incidents in which he frequently had occasion to show his grit and his qualifications for leadership. He managed the interests of the stove manufacturers during the great molders' strike in 1887, which resulted in the complete victory of the manufacturers, but was of more importance in bringing about improved relations between the manufacturers and the stove molders, through which peace has since been maintained without a break. Mr. Cribben's recollections of the ups and downs in the stove trade are vivid, and his conversation is replete wlth reminiscences of the most interesting character.

Fortune Gas Goods Plant.

For several years the Thomas-Roberts-Stevenson Company of Philadelphia have been devoting some attention to the manufacture of gas heating appliances in every way worthy of the name Fortune, by which they are familiarly known to buyers of gas goods. The demand for their line has grown to such an extent that they are now about erecting a separate plant for the manufacture of the Fortune gas heaters and cookers. Thls building will be 50 x 150 feet in size, affording a large floor space for assembling and finishing the castings, whlch wlll be made ln thelr regular foundry. This plant will be equipped with modern machinery and every facility for the production of carefully fitting and perfectly operating goods of attractive design and finish.

The Kalamazoo Stove Company.



It is expected that the new Kalamazoo Stove Company, Kalamazoo, Mich., will have their stove foundry in running order by the latter part of February. The buildings have been completed and are now being equipped. These buildings consist of a one-story foundry, 120 x 150 feet; a mounting building and warehouse, 150 x 200 feet, and a power house, in the immediate vicinity of both, containing two boilers, a large engine and a dynamo. The machinery will all be operated by electricity, power being thus easily transmitted to any part of the plant. The buildings are entirely constructed of cement, which is claimed to make them more absolutely fire proof than if constructed of either stone or brick. It was the intention at first to build only the foundations of cement, but the work proved so satisfactory that the walls of the building were completed with the same material, the only break in the solid cement being a narrow belt of brick in which the joists are set. The molding shop is equipped with a 67-inch Byram-Colliau cupola, having a capacity of 35 tons a day. The foundry will be large enough to accommodate 65 molders.

The statement is made that the company will sell their product directly to the user. The present plans of the company contemplate the exclusive use of newspapers and other advertising media to get their business before the people, avoiding the employment of travelling salesmen. The officers of the company are as follows: President, Edward Woodbury; vice-president and general manager, William Thompson; treasurer, C. A. Dewing; secretary, A. H. Dane.

The Acme Gas Range.

We present herewith a general view of one style of Acme gas range which has been got out by H. Adler & Co. of Pittsburgh, Pa. The sides of the range are made perfectly plain, but are heavily ribbed at the weak points. The company state that their reason for not using an ornamental side is that all their ranges are full asbestos lined and tightly cemented, so that no air whatever can come between the asbestos lining and the iron, thereby affording condensation between them, which would rust the oven in a very short time. This can only be done where the parts are perfectly flat. The plain cast side, it is said, can also be made lighter than the ornamented, and the less iron there is in the body of a range the less heat it will absorb.

All the burners in the Acme range are constructed and adjusted in such a manner that they will operate to entire satisfaction on low or high pressure, without the gas catching at the valve orifice on the lowest pressure or burning yellow on the highest pressure, and without changing the valve orifice in any of the valves after the mixer collars have been set properly for the gas on which the range is being used. The Acme is made in sufficient variety to meet many requirements and is referred to as first class in all respects.

The Acme Gas Range.

Keystone Stove Foundry.

As previously reported in *The Metal Worker*, the Keystone Stove Foundry of Spring City, Pa., were incorporated under the laws of the State of Pennsylvania with a capital of $60,000. This company bought the patterns and plant of the Schuylkill Valley Stove Company. At a meeting of the stockholders, held last Tuesday, the following directors were elected: E. B. Colby, H. N. Cole, W. J. Dykes, J. Edgar Diemer and M. Diemer. The Board of Directors immediately organized and elected E. B. Colby president and treasurer, H. N. Cole, vice-president; George M. Millspaugh, secretary, and J. Edgar Diemer, superintendent. The company will manufacture a line of coal stoves and ranges under the name Keystone. Preparations are being made to start up the plant with about 40 molders on the last of the month. The new company already have a number of popular stoves and ranges, and new additions will be made to the line during the year.

THE calendar for 1902 that is being distributed by the Quakertown Stove Company of Quakertown, Pa., 37 and 39 North Second street, Philadelphia, calls attention to their line of Ranges, Stoves and Furnaces, and also the Dangler Gas, Oil and Gasoline Stoves, which they handle. The principal feature of the calendar is a picture showing a gentleman of the old school presenting to his bride one of the Leader Ranges.

ODD PLATES.

A VERY pleasant "Daily Reminder" of the Phillips & Clark Stove Company of Geneva, N. Y., and of the Andes Stoves and Ranges, which they manufacture, comes to those who receive from the company one of the calendar engagement books which they are distributing under the title above noted. Weekly sheets, 5½ x 8½ inches in size, with blank spaces for notes against each date, are bound together in a cloth cover, each sheet being perforated so as to be readily removable after having been used. The company are also sending out a neat little memorandum book bound in celluloid and bearing on the cover their name and address, together with a reference to the Andes Stoves and Ranges. Inside of the book is a quantity of useful information, such as the rates of postage, interesting tables, statistics of population, weights and mensures, &c., together with calendars for 1902 to 1904.

A LARGE addition is being made to the plant of the Snyder & Baker Stove Company, Belleville, Ill., to be equipped with the latest machinery for the manufacture of a complete line of Steel Cooks and Ranges. It is expected that this department will be in full operation by March 1 next. The name selected for this new line is Early Meal, and they will be made in four different styles. The company will continue to make their well-known line of Stoves and Ranges, and they say that many new features of interest will be embodied in their new catalogue about to be issued.

GEORGE H. BARBOUR, vice-president and general manager of the Michigan Stove Company, issued a circular to the trade under date of January 2, announcing that the management of the company's Chicago house has been intrusted to Robert L. Morley, who for the past 18 years has filled the position of associate manager, and that J. B. McKewon will be associated with him in the management. He bespeaks for the new management the confidence and co-operation of the trade, stating that it will be the company's aim in the future, as in the past, to make Garland Stoves and Ranges "household words" and maintain the high reputation they have enjoyed. The company are also sending to the trade neat announcements of the particular traveling salesman who will call upon them in the interest of the company. This announcement is printed in gilt on a heavy black card in the shape of a shield, having a miniature calendar for 1902 attached at the bottom.

A VISIT to the foundry of the Belleville Stove Works, Belleville, Ill., finds them in the midst of active preparation for the coming season's trade. New goods and improved features in the old lines will be prominent in their line for 1902, and it will pay all dealers to send application for their new catalogue soon to be issued.

THE WESTERN ÆOLIPYLE COMPANY have removed their office and warerooms from Lake and State streets to 134 Lake street, Chicago. They exhibit their device in operation as attached to a furnace. The company are meeting with encouragement in introducing this fuel saving device, which has been illustrated in these columns, to the citizens of Chicago. It consists of an attachment to the smoke pipe of any heating apparatus, introducing at this point a current of air, which is claimed to secure more perfect combustion of fuel.

THE DOYLE AIR BURNER COMPANY have established a salesroom at 132 Lake street, Chicago. In this salesroom they exhibit their heating apparatus in various forms. The company have adapted the Doyle principle of combustion to their own construction of Gas Heaters, Parlor Heaters, Base Burners and Hot Air Furnaces. The principle covers the admission of heated air at a point where it is thoroughly mixed with the gases as they arise from the consuming fuel, the ignition of these gases causing a secondary combustion to take place. The company claim that, with their principle, bituminous coal is burned with most satisfactory results. They have a report of a careful test made by Skinner & Sethman, a prominent firm of engineers of Denver, Col. A test of one of the Doyle Heaters against one of the best Heaters of the ordinary type showed that for every 61 pounds of coal used by the other Stove the Doyle Stove required only 15 pounds and 2 ounces to maintain the same temperature. The company claim that one of their Hot Air Furnaces with an 18-inch grate will heat up to 50,000 cubic feet of space, and that soft coal is the ideal fuel for this type of Furnace construction. The Heaters constructed on this principle are adapted to the use of any combustible matter whatever.

IT is reported that a new Stove foundry is shortly to be established at New Berlin, Pa.

THE CLEVELAND STEEL RANGE COMPANY, Cleveland, Ohio, inform us that C. H. Hostetter, formerly manager of the Odin Stove Mfg. Company, Erie, Pa., has accepted the position of manager of their Gas Range and Gas Appliance department. The company are sending out a four-page folder giving half-tone engravings of their Gem Ideal Gas Ranges. They state that in Mr. Hostetter's care the improvements in their Grand Ideal and Gem Ideal Gas Ranges will be pushed, and the trade are assured that nothing better in the line of Gas Appliances can be secured. The company invite the trade to secure circulars and to correspond with them when in need of either Gas or Coal Ranges.

THE SPRINGFIELD FURNACE COMPANY, Springfield, Ohio, have been busy in bringing out a new pattern of the Thompson Gas Furnace for warm air heating. They state that the demand for their Furnace has been greater than they could supply, necessitating the postponement of the construction of the Thompson Furnace using oil fuel. A recent order from Pittsburgh called for 13 of their gas burning Furnaces. The company have recently applied for some new patents to be embodied in their new construction, which will be pushed to the extent of the facilities of their manufacturing plant.

A. WEISKITTEL & SON, Baltimore, Md., are sending to the trade a circular of their White Porcelain Enameled Top Fire King Gas Range, accompanied by a circular letter pointing out the advantages of the Fire King line, and requesting the trade to correspond with them in reference to the goods.

CAREY A. MOORE was a visitor at *The Metal Worker* office this week. Mr. Moore is well known to the trade in Philadelphia, Baltimore and the Southern Atlantic States as the representative of the Acorn line of Stoves and Ranges made by Rathbone, Sard & Co., Albany, N. Y. He has largely increased their popularity and use in the territory named. Mr. Moore has recently visited the plant in Albany, and is now conversant with all of the features of his line for 1902 and the specialties which he will have to present.

CHAS C. HEATH & Co. of Baltimore and Philadelphia are now quartered in their new and commodious Philadelphia branch store and warehouse, 136 and 138 North Second street, where they are in possession of greatly increased facilities. Stove Repairs will be handled on an extensive scale, covering all lines of Stoves made in this country and particularly those made in the New York, Pennsylvania and Baltimore districts. A rather novel plan is proposed by the company in connection with this line. A special tag will be attached to all Stove Repair shipments, called their Gold Seal premium tag, which will entitle purchasers to premiums of various values. Henry Swartz continues in charge as manager of the Philadelphia branch and has the assistance of John Bell, in charge of the floors, and John Kahmer, in charge of the department of Stove Repairs. Both the latter are well known on Second street, having been connected with the Philadelphia Stove trade for a number of years.

GEORGE H. HOLLAND, vice-president and general manager of the Bridge & Beach Mfg. Company, St. Louis, has been compelled to spend some time at Boston, owing to severe illness, while on his way home from a trip to Europe. He will reach St. Louis this week. The many friends of Mr. Holland deeply sympathize with him in his affliction and earnestly hope for his speedy recovery.

THE COLUMBUS STOVE COMPANY of Columbus, Ohio, have recently been incorporated with a capital stock of

$50,000. The incorporators are J. W. Hastings, F. B. Everett, J. C. Campbell, S. E. Jones and G. A. Willing.

Charles C. Heath & Co., Baltimore, Md., are send- to the trade a 16-page pamphlet devoted to their National Hot Air Furnace, which is made in two styles, designated as the 200 and 300 Series. The 200 Series is a construction including a crab surmounted by an annular drum, through which the products of combustion pass before reaching the smoke outlet. The 300 Series has a large combustion chamber immediately above the fire with an outlet into an annular drum through which the gases pass to the chimney. Both series of furnaces are provided with labor saving grates, and made in five sizes, with casings 32 to 50 inches in diameter, and rated to heat from 15,000 to 60,000 cubic feet of space in residences, and from 20,000 to 80,000 cubic feet of space in churches or stores.

The Co-operative Stove & Foundry Company, Wheeling, W. Va., have just completed a year which has been a record breaker in their history. The plant, although not a large one, has been in operation every day of the working season, and has turned out a large amount of material for the market. The management look forward to a very gratifying volume of business for 1902.

The new building for the Excelsior Stove Company at Quincy, Ill., has been completed and is now ready for occupancy. The contractor had 60 days in which to finish the job, but completed the work in 50.

The Peninsular Stove Company, Detroit, Mich., set forth the merits of the Peninsular Planished Steel Range in a little pamphlet printed in colored inks, which they have issued. The special features of construction are separately illustrated and described in a way to render their operation clearly understood, while a number of general views give an idea of the various lines of Steel Ranges from which the dealer may select. A catalogue relating to the goods will be sent by the company to any one sufficiently interested to make application.

The Lennox Furnaces are considered in an attractively printed catalogue of 40 pages, which is being sent out by the Lennox Mfg. Company of Marshalltown, Iowa. The Furnaces are illustrated and described at considerable length, the salient features being discussed in a way to interest not only the dealer, but also the house owner. Directions are given for setting the Furnaces and diagams show how the brick work should be arranged. Tables are also provided showing the heating capacity of Furnaces, the size of cold air ducts, cold air register faces, warm air registers and pipes.

The Gurney Foundry Company, Limited, Toronto, Canada, are furnishing their friends in the trade with a poster calendar for the new year. It is of the regulation style, being bound at top and bottom with metal strips and having an eye for suspending upon the wall. The design of the poster is executed in colors and represents the interior of a kitchen equipped with an Imperial Oxford Range fitted with pipe shelves and elevated ovens. The cook has just taken from the oven a well browned turkey, and judging from the smile upon her face, the cooking has evidently been to her entire satisfaction. The leaves forming the calendar proper are attached to the lower portion of the poster.

Charles W. Goodnough has issued a circular to the trade calling attention to the fact that he has acquired an interest in the Prizer-Painter Stove & Heater Company, and that he will hereafter have sole charge of the business of the company in Western Pennsylvania, West Virginia, Western Maryland, Ohio and Kentucky. The headquarters for this territory will be at 717 Grant street, Pittsburgh, Pa., where ample warehouse and office facilities will enable the company to serve the trade promptly and satisfactorily. The circular carries a likeness of Mr. Goodnough, together with a *fac-simile* of the company's trade-mark.

Stanley Works, 79 Chambers street, New York, are selling representatives of the Hart & Cooley Company, New Britain, Conn., manufacturers of lines of Wrought Steel Registers and Ventilators, recently put on the market. These Registers, which are in an Indian lattice design, are made of stamped steel in japan, nickel plated and white enamel finishes regularly, or the surface can be finished in any style desired to harmonize with the interior. The same styles are made in all the regular sizes from 6 x 8 inches up. The Stanley Works will cover all the territory on this product that they cover on their own goods.

At Pittsburgh, an affidavit of defense was filed last week in the suit for $50,000 damages brought by the Monongahela Land Company against Graff & Co., Stove manufacturers in that city, whose business was taken over last year by the Pittsburgh Stove & Range Company. The plaintiffs owned property in Monongahela City, and to induce Graff & Co. to locate their works there conveyed to the concern 5 acres of land, and agreed to give a bonus of $25,000. The purchasers of lots were to pay the money to a trustee, the latter to hold it as security for the defendant company for the payment of this bonus. It was for the alleged breach of this contract that damages were asked. The defendant company deny they entered into the contract in bad faith, and say they were not obliged to show the plaintiffs any plans of the proposed plant. It is said there was collected from the sale of lots about $17,000, of which the defendant company received but $6425, although they expended $19,000 in removing their plant. It is charged that the plaintiffs expended $11,000 for other purposes. The defendant company claim the plaintiffs owe them interest on $7000 and $18,000, which was due when the contract was broken.

Wisconsin Retail Hardware Association.

The programme for the annual meeting of the Wisconsin Association has just been issued. As usual, it is in the form of a pamphlet, in which a number of advertisements appear, together with list of members, details of the convention, &c. C. A. Peck, Berlin, the energetic secretary of the association, under the heading, "A Few Words With You," refers in an introductory address to the work of the organization during the past year. He also makes the following appeal to nonmembers:

> Let me again most cordially invite you to "come with us and we will do you good." Don't wait until the meeting, but mail the secretary $2 to-day and that pays your dues until 1903.
>
> Don't try to save pennies by losing dollars. If you wait until you come into the annual meeting you may not come. Trade may keep you at home. You may feel too poor. You may have the smallpox or the baby may be teething.
>
> The one item of saving a large percentage on your fire insurance will of itself repay the item of dues many times over. Last year the membership who availed themselves of this privilege saved 35 per cent., and it looks as though they would save more this year.

The convention will be held at the Republican House, Milwaukee, on February 5 and 6. The following papers will be read at the meeting: "How to Build Up a Good Retail Business," by Fred. Kusel of Watertown; "Some of the Evils of the Trade," by F. Merbach of Ripon; "Relation of Traveling Men to Retailers," by H. L. McNamara of Janesville; "Benefits of National Union," by O. P. Schlafer of Appleton. Mr. Scofield of the Scofield Company, Sturgeon Bay, will also present a paper on a subject not announced.

Illinois Retail Hardware Dealers' Association.

As already announced, the annual meeting of the Illinois Association will be held in the commodious quarters of the Elks' Club, in Decatur, February 12 and 13. The headquarters of the association will be at the St. Nicholas Hotel. Members from Chicago and suburbs will probably travel to Decatur by special train, as the indications are that over 100 persons from that vicinity will attend the meeting. The convention promises to be a most interesting one, and a record breaking attendance is expected. Among those who will read papers are Chas. H. Williams of Streator, whose subject will be "Mental Equanimity;" ex-President Z. T.

Miller of Bloomington; H. C. Peppler, 700 Lincoln avenue, Chicago; Wm. T. Gormley, 78 East Randolph street, Chicago, and L. H. Clark of Rockford.

Cooper & McKee's Refrigerators.

An illustrated catalogue of their line of refrigerators and ice chests for the season of 1902 has just been issued by Cooper & McKee, 113-121 Gwinnett street, Brooklyn, N. Y. In it the place of honor is given to their glass lined refrigerators, which were first brought out last season and which, the manufacturers state, have proved an unqualified success. These refrigerators have been used extensively in hotels, restaurants and high class apartment and private houses in the Metropolitan district and also in the cities of the Northern, Eastern, Middle and Southern States with entire satisfaction. The makers claim that these goods represent the acme of high grade hygienic refrigerators, embodying all the important improvements modern science has devised. They are made of the finest materials. The warm and cold air flues are so arranged that a dry, cold, pure air is always in circulation and the food compartment with its doors is lined with 7-16-inch polished plate glass, all glass being set to glass, with ground edges, so that there is no metal or other material in corners to rust or deteriorate. The shelving is of aluminum, which will not rust, corrode or tarnish. Cuts of these glass lined refrigerators in natural colors are presented. They are made in nine sizes and styles.

The new Columbia refrigerators form another leading line to which special attention is directed. Both these lines of refrigerators are filled with "Neptune insulation," which, from its composition, is claimed to lessen compression, increase the storage of dead air and give additional insulation. They are also equipped with the company's new patent siphon, made of heavy japanned cast iron, screwed to the bottom of the refrigerator and so balanced that it is always in position and cannot fall off. Other goods illustrated and described in the present catalogue are Champion hard wood refrigerators, Household refrigerators, refrigerators specially designed for flats and apartment houses, also for delicatessens and restaurants, New Domestic refrigerators and ice chests, grocers' refrigerators and refrigerators for nursery use.

Enameled Steel Wares.

The National Enameling & Stamping Company, 81-83 Fulton street, New York, have issued, under date of January 1, 1902, their catalogue No. 3, illustrating and describing the various lines of enameled steel ware which they manufacture. In a notice to the trade the company explain that in their first catalogues an effort was made to include each and every item of enameled steel ware formerly manufactured by their predecessors. Experience has proven, however, that quite a few slow and poor selling items were embodied in the catalogue, and in issuing the latest publication their object has been to eliminate all such items and show only such goods as they make and carry in stock at all times, and which can be furnished promptly.

The present catalogue contains between 400 and 500 cuts, and gives the list price of each item. This list applies to the different styles of enameled steel wares, except ornamental wares, but is subject to different discounts, which will be quoted on application. In connection with each article listed there is also shown exactly in what different finishes it is made. The various finishes include Royal, National, Greystone, Granite, Venetian, Blue and White and all White. The company announce that since issuing their former catalogue they have decided to discontinue the manufacture of the Brilliant enameled steel ware. Seventy pages of the publication are occupied by the company's long line of enameled steel wares, and five pages at the end are devoted to ornamented enameled steel ware. This is of high artistic merit and embraces some very handsome goods, including jardinieres, cuspidors, water pitchers, cups and saucers, dinner plates, soup plates, chambers, &c.

Cape Cod Commercial Travelers' Association.

The fifteenth annual banquet and ladies' night of the Cape Cod Commercial Travelers' Association was held at the Parker House, Boston, on Friday, January 10. Over 100 ladies and gentlemen attended and the following, with President and Mrs. George E. Hunt, held a reception previous to the dinner: Hon. George A. Hibbard, postmaster of Boston; James J. Myers, speaker of the House of Representatives; Senator William A. Nye, Col. Charles K. Darling, Rev. George G. Hamilton, Hon. H. Heustis Newton, Charles B. Sanford, president Worcester Commercial Travelers' Association, and Walter C. English. The after-dinner exercises were in the hands of the retiring president, George E. Hunt of the Henry N. Clark Company, Boston, who made an admirable toastmaster. Music was furnished by the Royal Banjo, Mandolin and Guitar Club and Miss Maud Smith of Toronto, gave recitations. At the close of the dinner President Hunt delivered an address of welcome and introduced in turn each of the special guests, who responded with speeches. The affair was a success in every particular. The Executive Committee who planned the entertainment were Henry B. Black, Frank A. Gorman, Clarence W. Newman, E. Frank Withington, Charles E. Gill, W. R. Lapham, George A. Jerauld and the following Reception Committee performed their duties handsomely: William B. Seignious, chairman; George H. Gibson, Edward B. Slocum, Herbert W. Marshall, Gardner F. Packard, Edgar F. Power.

Preceding the dinner there was an election of officers for the ensuing year, the successful ones being as follows: Clarence W. Newman, president; Henry B. Black, vice-president; Arthur T. Knowles, secretary; Clinton E. Hobbs, treasurer; Charles E. Gill, Walter S. Haynes, Jr.; Charles A. Haines, George E. Hunt, W. R. Lapham, H. W. Marshall, George E. Jeraud, Executive Committee; George M. Carpenter, George E. Hunt, Sick Benefit Committee; Clinton E. Hobbs, W. R. Lapham, John F. Randall, Railroad Committee, and Andrew Hawes, Edward B. Slocum, Augustus D. Wonson, Auditing Committee.

The Derby Twentieth Century Can Opener.

The W. H. Plumb Novelty Company, Ansonia, Conn., are offering the can opener herewith shown. In use, after pushing the point of the opener through the center of the can, the knife is slid along on the bar to the

The Derby Twentieth Century Can Opener.

required distance from the point to cut the desired opening in the can. It is then locked in place by pushing down the small lever. The opener is referred to as being made of tool steel, tempered, and as being durable. It is explained that it is easily adjusted, that it will open any sized can, large or small, cutting out the top smoothly, and that no rough edge is left to cut the hands.

THE copartnership heretofore existing between J. P. Ford and H. P. Taylor, doing a retail Hardware business under the firm name of Ford & Taylor at Laconia, N. Y., was dissolved on January 9 by mutual consent.

PATTERN FOR LEADER OFFSET.

A New York correspondent writes us that he is putting up some square paneled leaders, to be connected to the hub of a round cast iron pipe, as shown in Fig. 1,

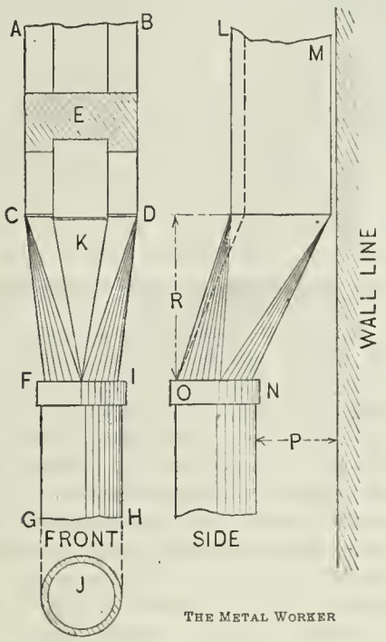


Fig. 1.—Reproduction of Correspondent's Sketch.

and asks us how to obtain the pattern of the offset. In Fig. 1 is shown a reproduction of our correspondent's sketch, in which A B C D is the front of the paneled leader, the section of same being shown by E, and F I H B the cast iron pipe. K shows the offset required to join the square leader with the round hub. J is the section of the iron pipe. L M N O shows the side view of the square pipe, offset and iron pipe, P indicating the distance that the iron pipe sets off from the wall, and R the required hight of the offset.

When getting out the shop pattern it is not necessary to draw the front or side view of the offset. All that is necessary is a plan view, as is shown in Fig. 2. Then, knowing the hight of the offset, the triangles will be constructed as will be described in connection with Fig. 3.

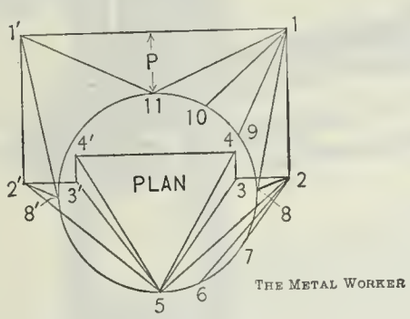

Fig. 2.—Plan and Bases of Triangles.

Thus in Fig. 2 let 1, 2, 3, 4, 4′ 3′ 2′ 1′ be the plan view of the square paneled leader, and 5 8 11 8′ the plan view of the hub of the cast iron pipe, P representing the distance that the iron pipe projects beyond the back of the square leader. As the iron pipe is central below the square leader, it is only necessary to divide one-half of the round plan as follows: Divide the quarter circles 5 8 and 8 11 into equal spaces, as shown by the small figures 5 to 11. From the corner of the square pipe 1 draw lines to 11, 10, 9 and 8, and from the corner 2 draw lines to 8, 7, 6 and 5. In similar manner from the corners 3 and 4 draw lines to the point 5 in the round pipe. The corner lines can be duplicated on the other half, if so desired. These lines form the bases of the triangles shown in Fig. 3. Erect any line, as 1 1′, equal to the hight that the offset is to have, as at R in Fig. 1. At right angles to 1 1′ and from 1 and 1′ draw lines indefinitely, as shown. Now take the various distances in Fig. 2 of 1 11, 1 10, 1 9 and 1 8 and place them on the horizontal line in Fig. 3, as shown by similar numbers, measuring in each instance from the point 1. Then from points 11, 10, 9 and 8 draw lines to the apex 1′. To avoid a confusion of lines erect another vertical line, as 2 2′. Then take the various distances in Fig. 2 of 2 8, 2 7, 2 6 and 2 5, and place them on the horizontal line in Fig. 3, as shown by joints 8, 7, 6 and 5, measuring from the point 2. Then draw lines to the apex 2′. From the point 5 erect the vertical line 5 5′. Take the lengths of the two lines in Fig. 2, 5 3 and 5 4, and measuring from the point 5′ in Fig. 3 by the same method obtain the points 3 and 4, from which draw lines to the apex 5. Then will these lines or hypotenuses represent the actual distances on the finished article on lines having similar numbers in Fig. 2. For the pattern proceed as is shown in Fig. 4. Draw any horizontal line, as 1 1′, equal to 1 1′ in Fig. 2. Now with 1′ 11 in Fig. 3 as radius and 1 and 1′ in Fig. 4 as centers describe arcs intersecting each other in 11. Now with radii 1′ 10, 1′ 9 and 1′ 8 in Fig. 3 and 1 in Fig. 4 as center describe arcs, as shown by 10, 9 and 8. Now set the dividers equal to the spaces into which the half circle in Fig. 2 is divided, and starting from the point 11 in Fig. 4 step from one arc to another, thus obtaining points 10, 9 and 8. From 8 draw a line to 1. Now with 1 2 in Fig. 2 as radius and 1 in Fig. 4 as center describe the arc 2, which intersect by an arc struck from 8 as center and 8 2′ in Fig. 3 as radius. Now with 2′ 7, 6 and 5 in Fig. 3

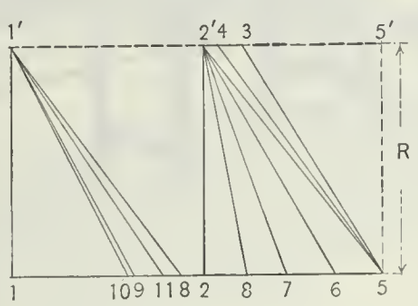

Fig. 3.—Diagram of Triangles.

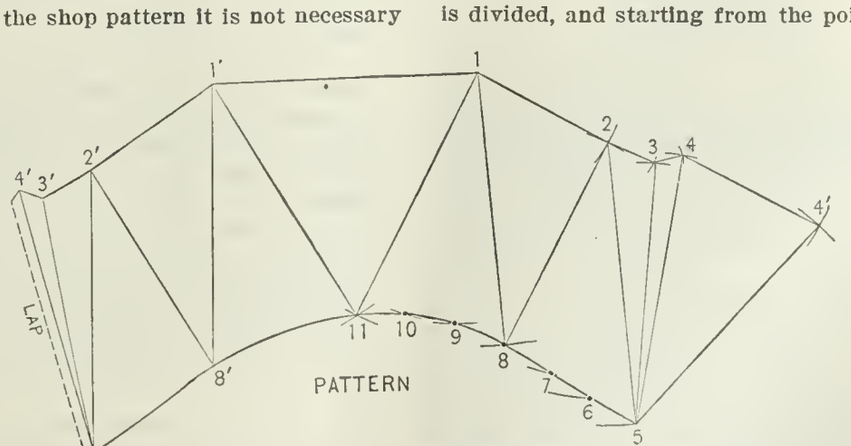

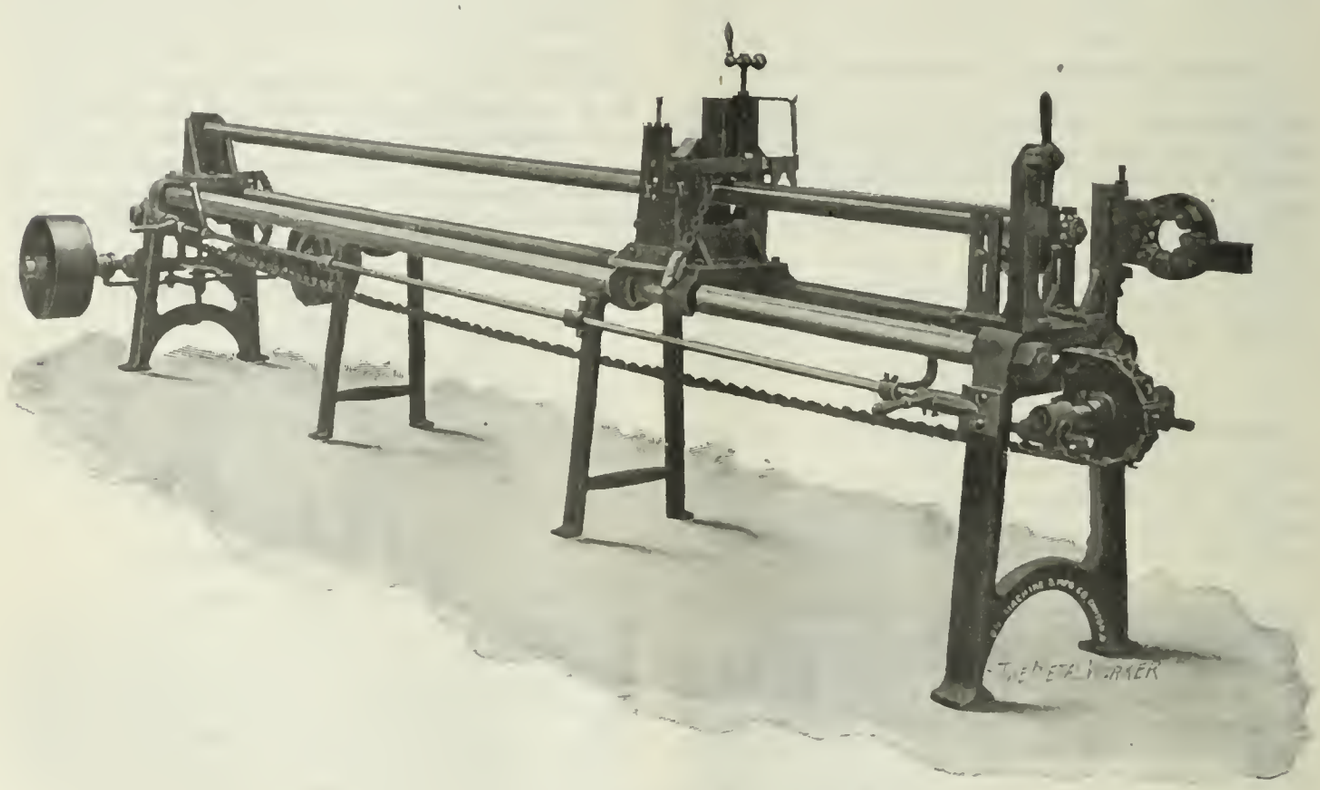

Fig. 4.—The Pattern Shape.

as radii and 2 in Fig. 4 as center describe the arcs 7, 6 and 5. Then set the dividers equal to the spaces in the half circle in Fig. 2, and starting from the point 8 in Fig. 4 step from one arc to another, thus obtaining the points 7, 6 and 5. From 5 draw a line to 2. Now with 2 3 in Fig. 2 as radius and 2 in Fig. 4 as center describe the arc 3, which intersect by an arc struck from 5 as center with 5 3 in Fig. 3 as radius. Draw a line from 5 to 3 in Fig. 4. Now with 3 4 in Fig. 2 as radius and 3 in Fig. 4 as center describe the arc 4, which intersect by an arc struck from 5 as center with 5 4 in Fig. 3 as radius. Draw a line from 5 to 4 in Fig. 4. Now with 4 4′ in Fig. 2 as radius and 4 in Fig. 4 as center, describe the arc 4′, which intersect by an arc struck from 5 as center and 5 4 as radius. Draw a line from 4 to 4′ and from 4′ to 5. Now take a tracing of 1 2 3 4 4′ 5 8 11 and place it opposite the line 1′ 11, as shown by 1′ 2′ 3′ 4′ 5′ 8′ 11. Then will 4′ 1′ 1 4′ 5 11 5′ be the complete pattern. Allow lap, as shown.

Power Conductor Pipe Corrugating and Grooving Machine.

The illustration given herewith represents a new 10-foot power conductor pipe corrugating and grooving machine for manufacturing corrugated conductor pipe, which is being manufactured by the Canton Machine & Mfg. Company, Canton, Ohio. The company have applied for a patent on this device. The following points are presented in connection with this machine: Corrugated or plain pipe of any one particular size can be made without making any changes whatever in the machine. After the pipe is seamed the corrugating head can be turned aside and the plain section of pipe stripped off the machine. A single and substantial sprocket chain operates the carriage containing the grooving appliance and rounding rolls. This chain is placed directly under the center of the machine and therefore is no hindrance to workmen engaged in the operation of the machine. The single chain is claimed to be an improvement over the double chain, since it is practically impossible to divide the tension between two chains. The carriage is supported by two 3-inch steel shafts, on which it is swiftly and noiselessly drawn. All sizes and styles of pipe, from 2 to 6 inch corrugated, plain round, octagon, &c., or any design for which heads can be made, can be manufactured on this machine by adding the necessary parts, but the machine requires no other changes. In operation, one forward and backward movement of the carriage rounds a curved pipe, and another forward movement passes a section of pipe through the corrugating head and off the machine. The carriage is stopped automatically and can be operated from either end of the machine. The capacity of this machine, which requires the labor of but two men, is said to be from 10,000 to 15,000 feet of pipe per day of ten hours. The company claim that their method of corrugating with partially incased steel walls is a great improvement over the wheel heads and corrugating mandrel, in that the pipe made on their machine is straighter, more uniformly corrugated and more securely seamed.

Power Conductor Pipe Corrugating and Grooving Machine.

A Seasonable Roof Cement.

When a thaw sets in after a snow storm the roofer has frequent hurry calls to stop the downpour of water inside of a building, due to some leak in the roof which the thaw has discovered. To enable the roofer to stop such leaks properly and with little trouble, George Callahan & Co., 218 Front street, New York, manufacture a rubber roof cement which will stick to a wet roof. It is said that this cement can be applied to a leaky roof during a rain storm, and will stop a leak either permanently or until some special repairs can be made by the tinner with his fire pot and soldering outfit. It is also claimed that wherever the snow can be swept away from a strained seam or a rust hole, the cement can be applied and the leak stopped. The cement has a considerable elasticity and never becomes hard, either in the can when kept in the shop or when applied to the roof; consequently, it never develops cracks to destroy its usefulness. The house also make a specialty of an oil manufactured for the express use of roofers, in addition to a full line of paints for galvanized iron and other sheet metal work.

The Twentieth Century Machine is the title given by S. J. Vance, Carthage, Mo., to his Automatic Roof Washer and Water Filter. It is designed to be connected with a conductor bringing rain water from a roof and to prevent the first dirty water that might come from a dusty roof finding its entrance to the rain water storage tank or cistern. This device is also manufactured by the New Process Mfg. Company of Dallas, Texas.

LARGER SHEET METAL WORKING MACHINES.

A marked development in the sheet metal trade of recent years has been the demand for machinery adapted to the handling of larger work than formerly. In the line of cornice machines, for example, the manufacturers of sheet metal machinery note a very pronounced change. Some 15 years ago the longest machine made for bending galvanized iron was 6 feet; subsequently inquiries were occasionally received for machines 8 feet long. A leading firm of sheet metal machinery manufacturers in the Central West consulted at that time with cornicemen as to the advisability of getting up patterns for a machine of that length. They were met with the objection that a cornice brake 8 feet long was impracticable, and were advised against going to the expense of getting up patterns for such a tool. As the inquiries for a longer machine kept coming in, however, the firm at length decided to get up a set of patterns for one, and they occasionally found a corniceman sufficiently progressive to buy an 8-foot machine. The market, however, is now so changed that the firm in question say that where they formerly sold ten 6-foot brakes to one 8-foot they now sell 20 8-foot brakes to one of 6-foot. Moreover, they are now getting inquiries for 10-foot machines, and have recently gotten up 10-foot patterns, believing that in the near future the demand for 10-foot cornice brakes will be as much greater than that for 8-foot brakes as the demand for 8-foot brakes now exceeds that for the 6-foot machines. As before, when proposing to increase the length of their machine, many cornicemen now declare that 10-foot galvanized iron cannot be handled properly, and that a 10-foot cornice brake will never be a success. The firm, however, are satisfied, from their former experience, that they are on the right track, and that in turning out a 10-foot brake they will meet the demands of modern requirements. The manufacturers of sheet iron have begun to manufacture longer and wider sheets and the tools to work these sheets must necessarily be increased in size and capacity in correspondence. The manufacturers referred to had a similar experience with their corrugating machine, used for corrugating roofing and siding for buildings. When they first began to manufacture these tools the demand was for 10-foot machines, and roofers declared that that was as long as they ought to be made, as a longer machine would not work properly. However, the manufacturers got up a 12-foot machine, and state that at the present time most of the orders received for these tools are for those of the longer length.

Sharon Tin and Sheet Mills.

The erection of the 12-mill sheet plant of the Sharon Sheet Steel Company, a subsidiary concern of the Sharon Steel Company, Sharon, Pa., is progressing well, and it is expected to be in full operation by May 1. The capacity of the sheet mills, when completed, will be about 100 tons per day. The 20-mill tin plate plant of the Sharon Tin Plate Company, also connected with the Sharon Steel Company is reported in full operation, with a daily capacity of 200 tons of finished material. The Sharon Steel Company own all the stock of the Sheet Steel Company, and about 60 per cent. of the stock of the Tin Plate Company. They propose to add to their present equipment four additional open hearth furnaces, making 12 in all. The Sharon Sheet Steel Company have an authorized capital of $500,000, and the Sharon Tin Plate Company a capital of $800,000.

Work on the plant of the Sharon Tube Company, another subsidiary concern, is being rapidly pushed, and the plant is expected to be in operation by June 1. The directors of the Sharon Steel Company have authorized the immediate erection of two blast furnaces, with an aggregate capacity of 700 tons a day, raising the company's pig iron capacity to about 1200 tons daily. The total authorized stock of the Steel Company is $5,000,000. The concern, with their various branches, include blast furnace, open hearth furnaces, blooming mill, billet mill, wire mill, pipe mill, tin mills and sheet mills, and will, when finished, be one of the most complete steel manufacturing plants in the country. The company were incorporated about two years ago.

Death of Christopher Zug.

Christopher Zug, one of the oldest citizens of Pittsburgh, and a pioneer iron manufacturer of Western Pennsylvania, died on January 13 at his home in Pittsburgh, at the patriarchal age of 95 years. Mr. Zug was born near Carlisle, Pa. His grandfather, Christian Zug, settled near the site of Letitz, upon land granted by the Penn family, and which is still held by the Zug family. Christopher Zug went to Pittsburgh in 1835 and ten years later joined the firm of Graf, Lindsay & Co., iron manufacturers. In 1864 the firm became Zug & Co. Mr. Zug was actively identified with the business of Zug & Co., Limited, until a few years ago. The firm are among the largest manufacturers of sheet iron in the country. The deceased was a thoroughly trained mechanical engineer, and studied out many improvements which have been utilized in the development of the modern rolling mill. His scientific knowledge was very broad and he was regarded as one of the leading botanists of the country. He was interested in many financial and charitable institutions in Pittsburgh, and was widely known for his philanthropic work, especially in connection with hospitals, having been on the Board of Management of several of those institutions in Pittsburgh. He was one of the founders of the Pittsburgh Bank for Savings and a director of that institution to the time of his death. Mr. Zug married Miss Eliza Bair of Hanover, York County, Pa. He is survived by a son and three married daughters.

Roof Cement and Paint.

Stowell Mfg. Company, 114 to 134 Culver avenue, Jersey City, N. J., are manufacturing two roof specialties in addition to their lines of prepared roofings, among which are gravel, cork and asbestos covered roofings, in addition to the plain asphaltum felts. One of the specialties is an elastic rubber roof cement, guaranteed by the manufacturers not to crack or become brittle, and designed particularly for repairing leaks in roofs, around chimneys, skylights, dormer windows, copings, gutters and elsewhere. It can also be used for securely fastening loose or broken slate and bedding tiles. Another commodity of similar character is black asphalt roof paint, for use on tin and iron roofs, bridges, gas tanks and underground pipes. It is said that tin roofs, even when rusted, broken and leaking, can be rendered water tight and serviceable with this preparation. It will withstand extreme heat or severe cold. It is easily applied and always ready for use.

FLASHINGS.

The Neighling-Steinhart Company and the New Jersey Sheet Metal Mfg. Company have been consolidated, with a capital stock of $150,000, under the name of the Neighling-Steinhart Mfg. Company. The location of the concern is Carlstadt, Bergen County, N. J. The directors are Edward A. Neighling and Alfred Steinhart of Carlstadt, Edwin L. Decker and Lewis A. Thompson of Somerville and John Dickens of New Brunswick, N. J.

N. & G. Taylor Company, Philadelphia, Pa., announce that in addition to the manufacture of Tin Plate, in which they have been engaged for many years, they are now in a position to supply from their mills Open Hearth Soft Steel Sheets for stamping purposes, also Plate Iron and Steel. The company are now prepared to ship from their mills Heavy Sheets between No. 8 and No. 18 gauge, in widths up to 48 inches and in lengths up to 144 inches.

The Parkersburg Iron & Steel Company, Pittsburgh, whose plant is situated at Parkersburg, W. Va., have purchased the plant of the Budke Mfg. Company, at Canonsburg, Pa., and will remove all the machinery to Parkersburg, where a stamping plant will

be erected adjoining the company's Sheet mill. It is expected that most of the company's Sheet production will be consumed in the stamping plant. John L. Budke has resigned his position as superintendent of the Canonsburg plant of the American Tin Plate Company and will become superintendent of the works of the Parkersburg Iron & Steel Company, in which concern he is already interested. Mr. Budke will be succeeded as superintendent of the Canonsburg plant by Joseph Phillips of Washington, Pa.

Mark McDonough of Carnegie, Pa., has been appointed to succeed N. L. Taylor as superintendent of the Denniston, Ohio, mills of the American Sheet Steel Company. Mr. Taylor has been transferred to one of the company's other plants.

Inspection of the books of the American Tin Plate Company for the months of November and December showed no variation in the price of Tin Plates, consequently there will be no change in the wages of the Tin Plate workers for January and February.

The Maryland Sheet Steel Company of Cumberland, Md., started three of their Sheet mills last week.

Three Tin mills have been placed in operation at the Chester plant of the American Tin Plate Company at Chester, W. Va., which they purchased from the American Sheet Steel Company. The other mills will be put in operation soon, together with the pickling and tinning departments. The company will also erect a corrugating plant in connection with their Chester mills.

Cummings Brothers, Holyoke, Mass., are engaged in roofing the new Dickinson Hospital which is being erected in Northampton. They have just completed a roofing contract in connection with St. James' Church in Springfield.

The Cincinnati Punch & Shear Company, Cincinnati, Ohio, have shipped to the American Frog & Switch Company of Hamilton, Ohio, a Punching Machine weighing 23 tons, which is said to be the largest machine of this kind yet built by the concern.

The new shops which the Wais-King Tool Company are erecting at Clifton avenue, Cincinnati, Ohio, adjoining the Baltimore & Ohio and Big Four railroads, are approaching completion. The company expect to be ready to fill orders by next week. The plant is located on 3½ acres of ground, upon which has been erected a main building, two stories high and 160 x 80 feet; also a boiler house and engine room, all of brick. The plant will be used for the construction and erection of the company's product, including Boring Machines, Mills, Punches, Shears, &c. At the start the company will employ about 100 hands. C. Wais, who for many years was at the head of the Wais & Roos Punch & Shear Company, will be the active manager of the mechanical department of the business, while Rufus King, Jr., will assume the responsibilities of the office management.

Neil M. Muirhead, Bridgeport, Conn., is placing Metal Ceiling and Siding in the store at the corner of East Main and Ann streets, Bridgeport.

Fire in the rolling mill of the National Enameling & Stamping Company, at St. Louis, Mo., on January 14, caused a damage estimated at between $60,000 and $75,000.

The remarkable development in the use of sheet metal for purposes for which cast metal or wood were formerly used is a pronounced feature of construction work to-day. As an illustration of this development the Ferracute Machine Company of Bridgeton, N. J., advise us that they recently furnished to a foreign government an outfit of machinery for making the sliding carriages which deliver the cartridges into rapid firing guns. These sheet metal carriages weigh only 2 pounds each, whereas the phosphor bronze carriages formerly used weighed 30 pounds and cost about ten times as much as those of sheet metal. Moreover, the sheet metal carriages have the additional advantage that a much larger number can be carried on mule back and other forms of transportation. The company have been officially advised that the carriages made by their machines have proved very successful in use. There is undoubtedly a growing tendency to replace castings and forgings with sheet metal in many different lines of work.

The Alan Wood Company have started work on their new plant for the production of Basic Open Hearth Steel. Five 50-ton furnaces will be erected, having a capacity of 100,000 tons of Steel a year. The new plant is situated at Ivy Rock, about 1 mile north of Conshohocken, and will extend over 175 acres of ground. The purpose of the plant is to supply the Alan Wood Company's Sheet mills at Conshohocken with Slabs and Billets. At the present time the company have to buy their Billets, and a considerable saving will be effected when the new plant is in operation.

A test of the fire proof qualities of Schratwieser's Patent Sheet Metal Lath, made by the Schratwieser's Sheet Metal Lath Works, 426-432 Third avenue, Brooklyn, occupying a week, has been made under the supervision of the Building Department of New York City, for the purpose of demonstrating the efficiency of that material. The Lath has been used extensively in elevator, dumb waiter, light and vent shafts in buildings in the vicinity of New York and throughout the country. Its features of merit are the excellent key surface which it provides for the mortar and the rigidity of the wall surface maintained by the bead which runs across the sheets at frequent intervals. The Lath is so made that it can be readily applied, and is especially adapted for the use of heating contractors who must cover their wall flues. The test resulted in a successful demonstration of its efficiency.

A. L. Hammerberg of the Tennessee Coal, Iron & Railroad Company of Ensley, Ala., has been appointed chief mechanical engineer of the Youngstown Iron, Sheet & Tube Company of Youngstown, Ohio. He was formerly connected with the Duquesne Works, and later with the Wellman-Seaver Company of Cleveland.

The Wheeling Roofing & Cornice Company of Wheeling, W. Va., have increased their capital stock from $50,000 to $500,000, and plans have been made for the erection of a new plant at New Martinsville, W. Va. Two buildings will be erected, one 90 x 220 feet, and the other 60 x 120 feet. A large amount of modern machinery will be installed.

The Canton Roll & Machine Company, Canton, Ohio, will erect an addition to their plant.

The Bradford Metal Stamping & Machine Company have been organized at Bradford, Pa., with a capital of $20,000, of which $15,000 is said to have been paid in. The concern are about completing a two-story building and expect to start business about February 1. They will manufacture Galvanized Finials, Cornices, Skylights, &c. O. W. Pierce of Olean, N. Y., is president and general manager.

The Consumers' Can Company, Baltimore, Md., recently incorporated with $400,000 capital, have taken over the business formerly conducted by the Consumers' Can Company of Baltimore, and have leased a large property in that city that will more than treble the capacity at that point. They expect to locate in their new quarters at Central avenue and Fawn street in February, and will have a capacity to use about 150,000 to 200,000 boxes of Tin Plate per annum at each plant. They are also negotiating for a site in the vicinity of Chicago for the location of a new plant.

The Ohio Galvanizing & Mfg. Company of Niles, Ohio, recently incorporated with $100,000 capital stock, have organized as follows: F. F. Bentley, president; W. H. Smiley, vice-president; A. J. Bentley, secretary-treasurer. Their new plant is nearly completed, and they expect to commence operations within a few days.

It is stated on good authority that a company will be organized at Louisville, Ky., to be known as the Louisville Steel & Iron Company, with a capital of $500,000, half of which is to be used for the erection of a plant for the manufacture of Steel Billets, Black and Galvanized Steel Sheets and other Steel products. It is understood that half of the amount necessary for the building of the plant has been subscribed. Davis, Kelly & Co. of that city are said to be interested.

CAST IRON BOILERS FOR LOW PRESSURE STEAM AND HOT WATER HEATING.*

BY DIRECTOR SCHIELE OF HAMBURG.

Translated from the German by Charles F. Hauss.

This subject was brought before you in 1896 by the late Engineer Strebel, whom most of you will remember. The manufacture of cast iron boilers in Germany had at that time only just been started in good shape. Hence we were then asked to refer to American makes and results for any knowledge of the subject. To-day things are different.

The beginning of the manufacture of cast iron boilers in Germany, as we speak of it to-day, dates back to the year 1894. This industry has rapidly grown, so that there are now quite a number of German factories that manufacture cast iron boilers. We have, therefore, seven years' experience, and I can assure you at the outset that the experiences have been good ones—at least where no sins were committed in the matter of construction.

When I now enter on the matter of material that goes into the construction of these boilers, there are two questions that arise in the comparison with wrought iron boilers. The one is, What is expected of the material in the construction and finishing? The other is, What advantages has this material to offer?

Cast iron has not the elasticity of wrought iron nor its flexibility. Therefore it is necessary to keep in mind that a body which is to be surrounded partly by fire, by smoke gases, by air, on one side, and by water or water and steam on the other side, must have every provision for expansion and contraction.

Owing to its liability to fracture it is necessary to avoid large flat surfaces, for if recourse is taken to ribs or stays, cast either inside or outside, to stiffen or strengthen the surfaces these may cause undesirable strains or fractures. Iron used in cast iron boilers should be close and soft, and particular attention must be paid to the cooling during and after pouring to avoid any undue strains in the castings. The maker must have every facility for thoroughly testing his castings.

I give you the following example of value of cast iron as a material for boilers: A colleague reported to me that a cast iron boiler was used during the entire severe winter of 1900-1901 on a closed tank or high pressure system of hot water heating in which the temperature of the water never was under 266 to 302 degrees F. The remarkable thing in connection with this is that the gases escaped directly into the air without a long smoke flue, yet the fire doors were always red hot, and the boiler has suffered no defect from its hard use.

The division of large cast iron boilers into sections is necessary owing to the kind of material used in their construction and manufacture.

The advantages offered by cast iron for boiler constructions are the following: The desired forms or shapes for the building of the fire chamber, fire surfaces and some flues are readily obtainable, and are so much in its favor as compared with wrought iron boilers as to make the value of its use beyond all doubt. The lower selling price and the possibility of using a water grate which can be a part of the section and adding to its fire surface must be looked upon as a special feature in its favor. The amount of space needed for a cast iron boiler is so much smaller that all of you probably thought or remarked when you first saw a cast iron boiler in use, when comparing it with the size of the house that it should heat, "This little boiler and that large house!"

The absence of rivet heads, offsets and joints, and the resultant smooth fire surface, is another advantage. The fact that in a heating plant a boiler is out of service and confined in a damp cellar in the summer time affords a cast iron boiler an opportunity to show its superiority over wrought iron boilers, because cast iron is less sensitive to the process of rusting. While wrought iron will continually scale and peel off, cast iron will take on one coat of rust only and does not peel off.

The ability of cast iron to resist the influence of bad water on its interior surfaces and the effects of smoke gases on its fire surfaces is not to be forgotten.

Turning from this sketch of the material to the matter of constructions that have resulted from its use, we have the position of the different sections. We find horizontal sections with vertical connections and vertical sections with horizontal connections, and in some cases also the drop tube type. Whether the boilers are built up in the factory or sent in separate parts to the building, to be assembled there, some form of connection is necessary, either packed joint or metal connections. The metal joints are made with either smooth or threaded nipples, the latter having right and left hand threads or only right hand threads with lock nuts. The bolts used are either short ones from section to section or long ones running the whole length of the boiler.

The above mentioned constructions are all similar in that the separate sections are joined together to make up the whole boiler. Yet the claims of the several manufacturers are as many sided as the results obtained. On one point all German manufacturers seem to agree; that is, the necessity of having a fuel magazine, while the American manufacturers mostly seem to avoid it. The reason for this is that the kind of fuel used and the demands on the boiler in America do not necessitate the use of a magazine.

After the magazine, which, as stated, is an accepted necessity here, come many different theories of interior construction. The drop tube boiler has only an upper connection, while the O shaped sectional boiler has two, and as the sections become nearer square they have, according to the arrangement of the magazine, three or four connections. The bases are usually separate, in which event they form the ash pit or smoke box, and where they are cast onto the section they in some cases carry the return openings.

Many boilers are covered with a sheet iron casing which forms a jacket, the space being filled with asbestos, or felt, &c., and again forming only a dead air space, the object of which is to prevent radiation of heat in the cellar.

A particular feature of many constructions is the automatic regulator, which is in most cases a part of the boiler. This regulator not only controls the air supply to the fire, but also the damper in the smoke flue. For cast iron boilers a reliable regulator is very necessary, because of the small amount of water contained and of the more effective ararngement of the fire surfaces, which make the boiler very sensitive and cause sudden changes in pressure and temperature, all of which can be controlled with the regulator.

The use of a steam dome has come much into favor lately, for the reason that it insures dry steam and helps to better extract the heat, in that it gives a better circulation of the water.

Referring to the inner construction of the boilers, and to follow these from the grate to the smoke box, we have first the grates. Most boilers have their grates cast onto the sections, in which case water circulates through them, and, besides keeping the grate cool and preventing its burning out, adds to the fire surface and precludes the possibility of the formation of clinkers or baking onto the grate. Other boilers have under or inlaid grates, either flat or round topped. In the latter case they are shaking grates, which are supposed to grind the clinkers and drop them into the ash pit.

From the grate the fire passes either through the fuel or sideways from the fuel. Both systems are good; yet it has been demonstrated by authorities that, when using coke, where the fire passes through the fuel the results are quite as good as where it burns off to the sides, for the reason that there is more contact surface.

The heated gases are carried in many ways to their exit in the smoke flue. Generally, however, it is accepted that to carry them vertically up or down is best, as the vertical smoke flues are self cleaning, especially

*Read at the third convention of German Heating Trades at Mannheim, Germany, August 14, 1901.

where the products pass downward. In this type of boiler especial care is to be taken in proportioning the flues so as to insure an equal division of the heated gases.

Some boilers on the market are made of two patterns or sections, while others need from three to seven patterns. It might be best to choose the simpler forms, so long as they are not less effective than the more complicated constructions.

The pressure to which the various manufacturers test their boilers is from 30 to 90 pounds per square inch. A factor of safety lies in testing to the highest possible pressure.

A cast iron boiler has very little capacity for storing heat. It is possible to have 1½ pounds pressure on a steam system in 20 minutes after starting the fire, while, on the other hand, it is well known that they rapidly lose pressure, which, as mentioned above, necessitates the use of a reliable regulator.

The surplus heat in cast iron boilers must be in the large amount of fuel carried, which emphasizes the necessity for a magazine feed. As fuel, coke has proved itself to be the best for magazine fed and regulated systems, because of the small quantity of gas that it contains, which accounts for its smokeless combustion. Second in line come anthracite or bituminous coals, which contain little gas. These can be used alone or mixed with coke, and will give economical results.

Fuels giving off large quantities of gas or tar are not to be used in cast iron boilers, except where there is a large combustion chamber for the proper mixing of the gases and air to burn them, as well as proper facilities for cleaning the smoke flues. Where fuel rich in gas is used it would be best to use surface burning boilers—that is, without the magazine.

The efficiency of cast iron boilers, even in the smaller sizes, is much higher than in wrought iron, owing to the better arrangement of the flues and contact fire surfaces. The ratings shown in the catalogues and price-lists of the several manufacturers vary from 2800 to 5800 B. T. U. of heat per square foot of fire surface. One American price-list shows a rating equal to 8000 B. T. U. per square foot of fire surface.

After several defaults at the start, which were to be expected, cast iron boilers have constantly grown in favor, so that at the present time their use is very large. Confidence in them is now universal, and State and city authorities no longer offer objections to their use. The number of boilers used on a single job has also increased, so that it is not unusual to see six to eight boilers coupled together on a single system. That this arrangement of the heart of the apparatus is defensible and strengthens the reserve power needs no special mention here.

The objections offered against the use of cast iron as material for the construction of boilers are still present to some extent; that is, as far as they refer to its liability to fracture from extreme pressure or sudden change in temperature due to freezing or burning, or to its having lesser tensile strength than wrought iron. All other objections can be overcome by care in manufacture, or at least be reduced to a minimum, and I can assure you from experience that the number of defects in material discovered in cast iron boilers was in only a minute fractional per cent. of the boilers sent out.

These objections are more than offset by the many advantages offered by cast iron boilers, and I wish to close this paper by bringing these to your notice again. The ability to make the boiler in sections and to send it, either as a whole or in parts, to the building and assemble it there. This will surely commend the cast iron boilers to those who have ever had to install a heating apparatus in an old building.

The sectional boiler will supply any demand, the same as the radiator. It is built for present needs, and in the shortest possible time can be enlarged or repaired; so the manufacturer has only to carry in stock sections instead of complete boilers. Hence the consumer's risk is reduced without lengthening the time for delivery.

The cast iron boiler requires much less room, needs no brick setting, and has a higher efficiency because of the better arrangement of the fire surfaces than is possible in wrought iron boilers, with the consequent better utilization of the products of combustion.

The price of cast iron boilers is about the same as that of good wrought iron boilers. The brick setting, with all its cost and disadvantages due to cracking walls and the large amount of space required, is unnecessary with cast iron boilers.

I believe that the self evident advantages that I have shown, and to which many others could be added, should commend the use of cast iron boilers for central heating, and I hope that my hurriedly arranged short sketch will be of service to you.

The Pennington M. B. M. Boilers.

Phelps Bros., 284-286 Pearl street, New York City, are notifying their customers that they have given up the agency for the Henderson heaters, manufactured by the Prizer-Painter Stove & Heater Company, Reading, Pa., and that in the future they will be the Eastern representatives of the Pennington Foundry & Heater Company of Pennington, N. J., a new boiler and furnace foundry in which they are financially interested. The company's foundry is said to be one of the finest, most modern and complete in the United States. It is centrally located on the Central Railroad of New Jersey, one hour from New York City, which insures their patrons quick deliveries to all points.

They are now putting upon the market a perfect and up to date line of boilers and furnaces, including all the modern improvements known to the heating trade. Their furnace line includes a novelty, in that it is a complete deviation from the old style of furnaces, being constructed upon entirely different lines from any manufactured heretofore. They extend an invitation to all their patrons and the general heating trade to come and see samples of both boilers and furnaces upon their floors after January 15. Catalogues are now on the press and will be distributed by mail to the trade as soon as completed.

Sanitary Earthen Ware.

The catalogue devoted to sanitary earthen ware, which has just been issued by the Bellmark Pottery Company of Trenton, N. J., should be of exceptional value to the plumbing trade. It consists of 75 plate pages, full linen finished covers, the pages being secured by means of a silken cord, which enables additional plates to be added as new goods are brought out by the company. Each plate contains an excellent half-tone engraving of some plumbing fixture, so that a correct idea of its shape, ornamentation and construction can be secured. The text gives the code words, outside measure, list price and the finish, whether white, marbled or iron. The statement is made that, unless otherwise ordered, marbled finished goods will always be shipped. Each page bears the company's trade-mark, which is also put on their goods. It consists of a bell ready to be hung in a tower. The goods shown include plain and embossed lavatories of various styles, siphon jet and siphonic action water closets, hopper and trap, wash out and plain hopper closets. These are followed by a variety of urinals and fittings, railroad car closet fixtures, bed pans and druggists' mortars and pestles.

The new warehouse and factory plant of Cuyler & Mohler, Baltimore, Md., was recently shown by means of a half-tone engraving in the Baltimore *American*. The new building is four stories high, constructed to carry the heavy loads involved in a large stock of Plumbing and Heating Supplies. It is stated that the building is equipped with many original devices for handling the goods, as well as carrying an exhaustive stock of all of the lines which a contracting plumber and steam fitter may require.

PROGRAMME OF HEATING ENGINEERS' CONVENTION.

There is every indication that the eighth annual convention of the American Society of Heating and Ventilating Engineers, to be held in New York City next week, will be very interesting, as a perusal of the following programme will show:

TUESDAY AFTERNOON.

Regular Business.

TUESDAY EVENING.

Report of Tellers.
Reading of Paper—"Hospitals for Contagious Diseases and Their Ventilation," by Thomas Barwick (member of the society).
Discussion.
TOPICS FOR DISCUSSION:
No. 1. "The Tudor System of Steam Heating as Compared with the French System," as presented by M. Debesson in a paper read at the last annual meeting.
No. 2. "How Much Vacuum Can be Produced on a Steam Engine by Using the Exhaust Steam (through a heater) for Heating the Water of a Water Heating System Either by Gravity or by Aid of a Pumping System?"
No. 3. "What is the Relative Economy of a Hot Water Heating System Using the Exhaust Steam to Heat the Water Compared with Using the Exhaust Steam Direct in the Radiators by Aid of Some Air Extracting Apparatus?"
General Discussion.

WEDNESDAY AFTERNOON.

Reading of a preliminary report on a code for testing direct radiation heating plants. Presented by the Committee on Standards, together with a former discussion on same.
Discussion.
Reading of Paper—"The Temporary Warming of Large Hall of the Royal and Imperial Library, Vienna, Austria, for the Visit of His Imperial Highness, the Crown Prince of Germany, April 14, 1901," by Prof. Edward Meter of the Imperial Technical High School, Vienna. Translated from the German by Chas. F. Hauss (member of the society).
Discussion.
Reading of Paper—"Depreciation, Maintenance and Interest Charges," by Reginald Pelham Bolton (member of the society).
Discussion.
TOPICS FOR DISCUSSION:
No. 4. "Can a Hot Water Heating Apparatus be Improved by Using a Steam Boiler to Transmit the Heat to a Heater for the Purpose of Warming the Water to Heat the Radiators?"
No. 5. "What Advantage is There, if Any, in the Use of What is Known as the Closed Tank or Pressure System of Hot Water Heating?"
General Discussion.

WEDNESDAY EVENING.

The officers and New York members will entertain the visiting members at a dinner at the Arena, 39 West Thirty-first street, at 6.30 o'clock. The members and their guests will meet in the parlor immediately after the close of the afternoon session and proceed to the dining hall.

THURSDAY MORNING.

Reading of Paper—"An Investigation Into the Difference Between the Coefficients for the Thermal Conductivity of Building Materials Obtained by Peclet and Those Obtained by Later Experimenters," by A. B. Reck, Copenhagen, Denmark (member of the society).
Discussion.
TOPICS FOR DISCUSSION:
No. 6. "What is the Advantage (or Disadvantage) of Broad Grates with Shallow Firing Over Deep Fire Boxes and Intense Concentrated Fires on Small Grates in Hot Air Furnace Heating?"
No. 7. "What is the Advantage of Flame Heat from Active Firing of Small Quantities of Coal Over Heat Radiated from Heavy Intense Fires?"
No. 8. "The Advantage of so Constructing Hot Air Furnaces, &c., as to Take the Smoke, &c., from the Lowest Point of the Heater."
No. 9. "The Necessity for Maintaining the Proper Amount of Moisture in the Air of Artificially Heated Houses, Under the Law: 'Heated Air Demands Moisture in Proportion to Its Expansion.'"
No. 10. "The Advantage of Bringing Air Horizontally Upon the Heated Furnace (Giving Each Part of the Furnace Its Own Supply of Cold Air) as Compared with the General, almost Universal, Method of Passing a Thin Stratum of Cold Air Vertically Between a Jacket and the Furnaces."
General Discussion.

THURSDAY AFTERNOON.

Reading of Paper—"The Performance of Centrifugal Fans Under Actual Working Conditions," by H. Eisert (member of the society).
Discussion.
Reading of Papers.
Discussion.
Installation of Officers.
TOPICS FOR DISCUSSION:
No. 11. "What Can We Do to Impress Upon Owners of Buildings and Architects the Necessity of Adequate Smoke Flues for Heating Apparatus?"
No. 12. "What is the Proper Proportion of Grate Surface in a Boiler to the Radiating Surface in a Building in Low Pressure Steam and Hot Water Heating?"
Topical Discussion.
Adjournment.

ASSOCIATION NEWS.

Passaic, N. J., Master Plumbers.

The annual meeting of the Master Plumbers' Association of Passaic, N. J., was held on January 3, when the following officers were elected:

President, George S. Aldous.
Vice-President, Robert Cullen.
Secretary, Thomas R. Collins.
Treasurer, William Brooks.
Collector, N. Wentink.

Troy Master Plumbers.

The annual meeting of the Master Plumbers', Steam and Gas Fitters' Association of Troy, N. Y., and vicinity was held on January 8, when the following officers were elected:

President, Martin Mulligan.
Vice-President, Charles Wills.
Secretary, William F. Quinn.
Treasurer, William Ferguson.

These officers constitute the Board of Trustees.

Philadelphia Master Plumbers.

The annual meeting of the Master Plumbers' Association of Philadelphia, Pa., was held at the Builders' Exchange on Thursday evening, January 9, when the following officers were elected to serve for the ensuing year:

President, George F. Uber.
Vice-Presidents, A. M. Hicks, Samuel W. Barnes, John E. Eyanson, R. H. Watson and C. S. Warfield.
Secretary, W. S. Clark.
Treasurer, William Harkness.
Directors: S. Louis Barnes, E. F. Paulin, H. L. Righter, Gregor Drummond, R. J. Hoben and John V. McNally.
Sergeant-at-Arms, Elvin H. Mackay.

Kansas Master Plumbers.

The following call has been issued for the annual meeting of the Kansas State Association of Master Plumbers by Secretary A. P. Elder, Ottawa, Kan., under the date of January 10:

The Kansas Master Plumbers' Association will meet at 2 p.m. Monday, January 20, in Topeka (Sons of Herman Hall). This meeting will be one of the best we have ever held and I would urge that you attend. The Midwinter Fair commences on that date and you can secure a one-fare rate. Our association has steadily grown, until it now embraces very nearly the entire plumbing business of Kansas, and it is certainly not necessary for me to dwell upon the advantages of meeting the best posted men in our trade in friendly discussion and interchange of ideas. There are complicated

problems constantly coming up, and the easiest way to "get right" is by discussing them at our meetings. All branches of business now recognize the necessity of organization to correct the numerous abuses that beset all business ventures in this day and age. If you know of a good plumber having a regular place of business, secure his application for membership. The membership fee is $5 and the first six months' dues $3, which should accompany the application. (This will probably be raised at the next meeting.) You have no doubt had a good business in 1901, and a "day off" will do you good in many ways. The following well-known men have agreed to prepare and read papers that will unquestionably prove very interesting and profitable:

W. R. Golt, with the W. S. Dickey Clay Mfg. Company, "Modern Sewers."

John Bishop, Salina, Kan., "The Plumbing Business —Some Suggestions and Criticisms."

Carl Graeber, Lawrence, "Employer's Liability."

A new directory of recognized master plumbers will be issued February 1 by the National Association of Master Plumbers. Your dues should be paid not later than January 20 to insure your name appearing in the directory as in good standing.

Chicago Master Plumbers.

The Master Plumbers' Association of Chicago held their annual meeting on Tuesday night, January 14, and elected the following officers:

President, C. T. Byrne.

Vice-President, L. R. Bain.

Secretary, A. E. Mortimer.

Treasurer, Thomas Conlin.

Sergeant-at-Arms, J. B. Ryan.

In addition to the above the following were elected on the Board of Directors: C. M. Foskett, Frank P. Schuster, Joseph Reilly and D. J. Hickey, the retiring president.

Ex-President Hickey was presented with a valuable diamond ring by the members of the association as a token of their appreciation of his services during his term of office.

The Illinois Master Plumbers' Association will hold their annual convention next Tuesday and Wednesday, January 21 and 22, in East St. Louis, Ill.

To Defray Entertainment Expenses.

In view of the tension now existing between the manufacturers and the plumbers, the following letter soliciting the support of manufacturers in defraying entertainment expenses will be read with some interest:

MASTER PLUMBERS', STEAM AND GAS FITTERS' ASSOCIATION OF THE CITY OF ELMIRA, N. Y.

ELMIRA, N. Y., December 31, 1901.

Gentlemen: The master plumbers of the State of New York will hold their annual convention in our city during the first week in March, 1902. The local association of Elmira are doing all they can to make the same a success, and an interesting one to all visitors. We are preparing a souvenir programme, together with illustrations of many buildings and points of interest to the association. In this book we have a number of pages and desire to have you represented in same. The book will be 7 x 11 inches. We will accept anything you may offer for such a space; send us your ad. and any cut you may desire placed in same, and our association will appreciate the same. We propose to distribute a large number throughout the State. Let us hear from you at once.

Owing to the annoyance experienced in the past by the wholesale houses from the continual solicitation for contributions, purchase of tickets or advertising, the manufacturers, at a meeting held in Philadelphia, Pa., March 13, 1901, passed the following resolution:

Whereas, Members of this association have spent much money in advertising schemes, such as directories, programmes, souvenirs, pamphlets, bulletins and other publications of a purely temporary character and doubtful value; be it therefore

Resolved, That we, as members of this association, declare and agree that in future we will do no advertising in any directories, programmes, souvenirs or other publications that are distributed in whole or in part voluntarily, or which are not regularly issued, or which do not give the name and address of every resident in the city or town where published, or which do not give the name of all parties engaged in any certain particular line of business, or which are not sold to the trade, or in any pamphlets, bulletins or publications of any kind issued by any trade associations, nor any donation to the publishers or any association interested in any kind of said proscribed publications or subscribe to any entertainment, ball or picnic.

New York City Notes.

The yearly report of the Examining Board of Plumbers, as given in the *City Record*, shows that 272 applications were received and that 215 of the applicants received their certificates. Forty-four applications were rejected and 13 were pending on December 30. The average of almost one applicant for every working day shows that many men think the plumbing business is not yet played out from the masters' side.

* * *

Members of Richmond Branch are complaining of the action of the gas companies in that borough in doing gas fitting work for and soliciting trade from non-gas users. The companies are piping such houses at the rate of 75 cents a drop and are also selling them fixtures.

* * *

Manhattan is preparing to send a large delegation to attend the entertainment and reception of Brooklyn Branch.

* * *

Engel & McMahon of 28 St. Mark's place have just completed the plumbing in the New Star Theater at Lexington avenue and 107th street.

* * *

Considerable confusion is being caused by plumbers' bonds having to be filed in the various boroughs instead of at one office. Many plumbers filed their bonds with the Sewer Department, now defunct, during December, as required by law, and now find that the bonds must be transferred to their own borough.

* * *

The shop of Daniel Carroll, at 53 West Thirty-third street, was slightly damaged by fire last Monday morning.

Heating and Plumbing Notes.

THE GADSDEN PIPE WORKS of Gadsden, Ala., have let contracts for the erection of a building 125 x 200 feet, with all modern improvements, to be used for the manufacture of Pipe.

THE PITTSBURGH SEAMLESS TUBE COMPANY will shortly put in full operation the plant of the Atlantic Tube Company, Beaver Falls, Pa., which they purchased some time ago.

MARTIN FAHY, Waterbury, Conn., has been awarded the contract for plumbing the new parochial school and convent which the St. Thomas Roman Catholic Society are erecting in that city.

S. G. ADAMS, heating and plumbing contractor, 425 Main street, Hartford, Conn., who succeeded T. K. Conway a short time since, is now well established in his new quarters. Mr. Adams has had a long experience in the plumbing business, having been employed successively by the late James Ahern, Henry Leitch and Robert Garvie. His extensive acquaintance in the trade and many years' experience should assure him success in this new venture.

R. T. MARCY has sold his interest in the Marcy Mfg. Company, manufacturers of Wind Mills, Pumps, Tanks, &c., Bluffton, Ind., to E. V. Liners, who has held a position at the head of the company's sales department. Mr. Marcy is retiring from business. The Marcy Mfg. Company, who were organized about four years ago, consist of W. C. Elston of Union City; G. A. Ullman of Ashland, Ohio, and E. V. Liners, J. A. Ullman and E. L. Murray of Bluffton.

GEORGE M. COUCH, Hartford, Conn., has the contract for installing the plumbing in the new mill which is being erected in Burnside by the Taylor-Atkins Paper Company. He is also doing the metal work, &c.

W. H. KAVANAGH died at his home in Utica, N. Y., on January 5, after an illness of three months. He was born in Kilparish, County Wicklow, Ireland, April 25, 1832, and came to Utica in 1855. He learned the plumbing trade with T. J. Curley and in 1865 went into business for himself. At one time he conducted one of the largest plumbing establishments in Utica, his work extending into other States. As a young man he married Catharine Delaney of Utica, who, with four children, survives him.

WORK will shortly be begun on the extensive additions to the plant of the H. B. Smith Company at Westfield, Mass. The buildings include a foundry 212 x 80 feet, tumbling room and machine shop, all one story high, and to be constructed of brick, with gravel roofs. They will be of mill construction, with skylights, steel beams and concrete foundations, &c. The entire cost will be about $45,000.

AT the last meeting of the District Council of Plumbers of Hudson County at Council Hall, 11 Hoboken avenue, Jersey City, N. J., the following officers were elected: President, Joseph Lintner; secretary, James McArthur; treasurer, William Gallagher, and sergeant-at-arms, George King.

THE CURTISS & PIERPONT COMPANY, the well-known plumbing and heating contractors, of New Haven, Conn., have just issued a very attractive calendar for 1902.

JOHN STEPHEN SEWELL, captain of engineers, will receive sealed proposals at the United States Engineers' Office, Washington, D. C., until noon, February 3, 1902, for furnishing Ventilating Fans to be used in the new Government Printing Office.

AT a meeting of the library trustees recently held in the City Hall, Nashua, N. H., the contracts for heating and ventilating the library were let to the Merrill Company and the plumbing to C. H. Cronin, both of Boston, Mass.

A. A. MAYBACH, quartermaster, Fort Terry, N. Y., will receive sealed proposals until noon, January 28, 1902, for plumbing the frame barracks at that place.

THE AMERICAN BLOWER COMPANY of Detroit, Mich., are sending to the trade their catalogue No. 135, devoted to the A B C Hot Blast Heaters for heating and ventilating large public buildings and the drying of materials of all kinds. The catalogue presents a bird's-eye view of the company's extensive plant, which is followed by sectional views and views of partly constructed Heaters. These are accompanied by illustrations of Heaters incased, with Fans attached, and to be operated either by steam engines or electric engines. Tables accompany the Heaters giving full dimensions, size of piping and other particulars. The catalogue also presents sectional views showing the arrangement of the Fan and Heater in relation to the warm air and cold air passages and mixing chambers.

THE contract for installing a Kelsey Hot Air Heater in the new residence being erected for Lewis S. Welch on Prospect street, New Haven, Conn., has been awarded to W. A. T. Smith of that city.

LUTHER WILLIAMS has purchased a controlling interest in the East End Plumbing Company at Parkersburg, W. Va. He has been interested in the company for some time.

GEORGE CALLAHAN & Co., 218 Front street, New York, invite the steam fitting trade to submit their Steam Joint Cement to the severest practical test. They claim that this Cement will aid the steam fitter in making a perfectly tight steam joint, whether on low pressure work or high pressure work in connection with the modern high pressure power steam plants. The firm also make a Cement for plumbers' use, besides a variety of supplies for steam fitters and plumbers.

F. J. GAST, 26 Cortlandt street, New York, is sending to the trade a 24-page pamphlet devoted to Gast's Asbestos Air Cell Coverings for steam and other pipes to prevent the loss of heat. Cuts show the material arranged for application to steam pipes, hot air furnace pipes and steam boilers, and also as insulating material for indirect radiator stacks and for general sheathing purposes. The catalogue also contains a number of testimonials.

THE new calendar distributed by the Victor Heating Company, 2295 Broadway, New York, is well calculated to bring the company into memory when anything goes wrong with the heating apparatus. The president, John A. Connolly, and George O'Hanlon, secretary and treasurer, are both experienced men in steam and hot water heating in all its branches. They have made a specialty of high grade work and have also been called upon to do a great deal of custom work, such as the remodeling of unsatisfactory systems and remedying troubles with heating plants in the houses of their customers. This class of work, with numerous contracts to install new direct and indirect steam and hot water plants, has made the year just closed a good one for this enterprising and reliable house.

THE contract for plumbing the new brewery for the Weidmann Company of Allingtown, Conn., has been awarded to Chris. Herpich.

THE plumbers of Bangor Maine, are preparing to have the City Council pass an ordinance providing for the regulation of plumbing work, and the appointment of a plumbing inspector.

FRANK O. DUNN, Erie, Pa., has secured the contract for plumbing the Arcade Building, in that city.

THE CENTRAL SUPPLY ASSOCIATION will hold their regular quarterly meeting at the Hollenden Hotel, Cleveland, Ohio, on Tuesday, February 24.

CITY ENGINEER TURNER of Bay City, Mich., was reelected chairman of the Board of Plumbers' Examiners, and Dr. Gilbert was continued as secretary at the annual meeting recently held.

THE Ohio State Association of Master Plumbers will hold their annual convention in Cleveland, Ohio, on February 11 and 12.

BARNES MFG. COMPANY, manufacturers of Pumps, &c., Mansfield, Ohio, report 1901 business as the largest in their history. During the year their capacity was increased 25 per cent., and they have been running every day except holidays and shut down only three days for invoicing instead of ten days or two weeks as usual.

A CATALOGUE by Boyaird & Seyfang Mfg. Company, Bradford, Pa., considers their Boilers, Engines, Drilling and Fishing Tools, Iron Tanks, Refining Equipments and Oil and Gas Artesian Well Appliances. Their new electric drilling engine is built expressly for drilling oil, gas and artesian wells. These engines include all the essential points of a first-class engine and are superior for their strength, durability and economy of steam. The latest addition is their improved reversing lever. To this is attached a ⅜-inch pipe, which extends to within easy reach of the driller, thereby giving him instantaneous and direct control over the link valve.

A BOOKLET by the American Valve Company of Coxsackie, N. Y., describes their high grade Valves for water, steam, gas, ammonia, &c., and their improved Fire Hydrants. Their Gate Valves are so designed that the disks will seat perfectly, irrespective of expansion or contraction of the body when in service.

WE have received a pamphlet of the Tread-Kill Shaking Grate made by M. H. Treadwell & Co., 95 Liberty street, New York. This Grate is built for every size of furnace, and may be applied to every style of front. Every part of the Grate is so designed as to prevent warping, and there is no part which under the severest conditions will break or burn. The shaking movement will break clinker and clean a fire instantly from front to rear where free burning coal is used.

THE UNIVERSAL SANITARY WARE COMPANY, New Castle, Pa., will at once double their capacity, necessitating enlarged buildings and much new machinery.

THE BEST MFG. COMPANY of Pittsburgh have issued a series of tables in convenient form covering Cast Iron Flanges, Cast Iron and Steel Fittings, Cast Iron and Steel Reducing Elbows, Cast Iron and Steel T's, Pipe Bends, Climax Angle, Globe and Check Valves, Pres-

sure Reducing Valves, Centrifugal Separators, Cast Iron Fittings and Steel Fittings and Flanges.

The New Castle Stamping Company, New Castle, Pa., are proceeding rapidly with the erection of the buildings for their new plant.

The Welliver Hardware Company of Danville, Pa., who began to manufacture the Edgar Radiator last October, state that already they have done business with their Radiator in 13 States and have been encouraged by receiving duplicate orders.

A. J. Walker, Butte, Mont., bid $6800 and secured the contract for heating the Munroe Street School in that city.

Thomas McCarron has been appointed Plumbing Inspector of Minneapolis, Minn., by the Board of Health.

B. E. Sheehan of Bangor, Maine, has been granted a license to do plumbing in Oldtown, Maine.

The Magee Furnace Company, Boston, Mass., have furnished the boiler for the new steam heating apparatus in the First Presbyterian Church at Newport, R. I. It was installed by the Newport Foundry & Machine Company.

Hiram Oliver of the plumbing and steam fitting house of Oliver & Howland, 33 Taylor street, Springfield, Mass., died at his home on January 6, aged 66 years. He was born in Troy, N. Y., and went to Springfield when a boy. After he had learned the steam fitting trade he went into business with T. J. Gifford and F. H. Howland. Later he acquired Mr. Gifford's interest in the business, which was continued under the name of Oliver & Howland. He married Miss Jane Nely in 1860, who, with two daughters, survives him. Mr. Oliver was prominent in Masonic circles and a devoted church worker.

The plumbers of Marion, Ind., have petitioned the City Council for an ordinance to provide an inspector of plumbing and gas fitting in that city.

The Curtiss & Pierpont Company, New Haven, Conn., have the contract for plumbing, heating, gas fitting and tinning F. W. Benedict's new student apartment house.

J. P. Bagley, White River Junction, Vt., has the contract to install a Boynton boiler in the Dewey Hall, at Northfield, Vt.

In a suit against some master plumbers in St. Louis, Mo., asking that their association be restrained from alleged discrimination in regard to the sale of plumbing supplies, Judge Ryan dismissed the case on the ground that the plaintiffs had no interest in common and were improperly joined in the suit.

Powers & Stiles have moved their plumbing establishment to the Beadles Block on West Oklahoma avenue, Guthrie, Ok. T.

Patrick Glynn, a plumber of St. Louis, Mo., fell on the street on January 8 and died at the City Hospital without recovering consciousness. He was 55 years of age.

Seeger & Co., 79 North Clark street, Chicago, Ill., have filed an injunction in the Superior Court asking that the alleged "trust" in plumbing goods be restrained from further interference with the lawful conduct of their business. The members of the Central, Chicago and Confederated Supply Associations are named in the bill.

Thompson Bros., contractors, of Philadelphia, Pa., will install a steam heating plant in the new Fire Department station, at Fifteenth and Parrish streets, at a cost of $1250.

William McGonigal, who is well known to the heating and plumbing trade from his long connection with the Putnam Foundry Company, has gone into the heating and plumbing business, at 301 Union avenue, Mount Vernon, N. Y.

New Firms and Changes.

The Ramsden Steam Generator Company of Philadelphia filed articles of incorporation at Wilmington, Del., recently, the capital stock being $100,000.

The plumbing firm of W. P. Tarrant & Co., Saratoga, N. Y., have dissolved partnership, W. M. Ingmire, the junior partner, retiring. Mr. Tarrant will continue the business at the old location, 12 Maple avenue. Mr. Tarrant is a popular business man and a practical workman, having been associated with his father, Frederick Tarrant, who retired some time since.

The partnership existing between H. Brown of Brockville, Ontario, Canada, and James F. Read of Smith's Falls, doing business at Smith's Falls, has been dissolved. The business will be continued by Mr. Read.

F. F. Bentley of Niles, Ohio, has sold to Henry Ehlaner and G. C. Davis his entire plumbing and heating business. The new concern will be known as the Niles Plumbing & Heating Company. Mr. Ehlaner is at present located at Girard. Mr. Bentley retires from the business to take up a connection with the Ohio Galvanizing & Mfg. Company.

The Alexander A. Knapp Company have been incorporated at Dunkirk, Ind., with a capital stock of $10,000, to conduct a plumbing business. The directors are C. J. Slough, M. H. Hart and J. L. Slough.

Thomas Maddock's Sons Company of Trenton, N. J., have been incorporated with a capital stock of $600,000, to manufacture Pottery. The incorporators are Chas. S. Maddock, Archer M. Maddock and Harry S. Maddock, all of Trenton.

Harvey Gamble has opened a plumbing establishment on Third street, near the post office, Pratt City, Ala.

Production of Illuminating Gas in 1900.

The census statistics on the manufacture of gas in the United States in 1900 are given in a report just issued. The tendency toward concentration of industrial enterprises is exemplified in these figures, which show an increase as compared with 1890 of only 18 per cent. in the number of gas manufacturing establishments, while the increase in aggregate capital invested in gas making was 119 per cent. The average capital per establishment in 1900 was $646,523, as compared with $348,749 for 1890. The increase in the number of cubic feet of gas consumed was about 84 per cent. The average product per establishment rose from 49,217,670 cubic feet in 1890 to 76,503,482 cubic feet in 1900, an average increase of over 55 per cent. per establishment. The report shows a capital of over $567,000,000 invested in the manufacture of gas in 877 establishments in the United States in 1900. The annual value of the product of these concerns is returned at $75,716,693. The average price of gas obtaining throughout the United States shows a reduction from $1.42 in 1890 to $1.035 in 1900. This reduction in price caused the value of the product to show a lower rate of increase than would otherwise have been the case.

TRADE NOTES.

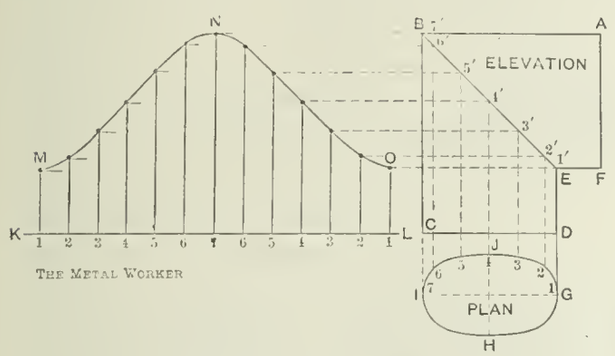
The Board of Health of Martin's Ferry, Ohio, is in the market for a Garbage Crematory. Manufacturers of such devices are invited to mail catalogues and quote prices to Dr. J. G. Parr, Martin's Ferry, Ohio.

The Joseph Dixon Crucible Company, Jersey City, N. J., are building a 100 x 200 foot addition to their plant.

The J. W. Paxson Company, Philadelphia, Pa., have taken over the entire business of the Mahoning Facing Mills Company, manufacturing Pipe Blacking, Car Wheel Mineral and Anthracite Facings, with mills located at Leslie Run and Lehighton, Pa., on the Lehigh River. Both mills having steam and water power will be operated, while the entire business will be transacted at the Philadelphia office of the J. W. Paxson Company.

The Tin Plate mill at Johnstown, Pa., owned by the American Tin Plate Company, is being dismantled, and the two Tin mills which it contained are being shipped to Monessen, Pa.

THE LETTER BOX.



Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PATTERN FOR OVAL ELBOW.

From N. B. H., Swampscott, Mass.—Will you kindly show me how to lay out the pattern for an oval elbow?

Answer.—In the accompanying illustration let A B C D E F be the elevation of the elbow, the plan or oval shape of which is shown by G H I J. Divide the half plan I J G into equal spaces, as shown, from which, at right angles to C D, erect lines intersecting the miter line E B at points 1′ to 7′, as shown. In line with C D

Pattern for Oval Elbow.

draw the line K L, upon which place twice the number of spaces contained in the half plan I J G, as shown by the small figures 1 to 7 to 1 on K L. At right angles to K L, and from these small figures, draw lines, as shown, which intersect with lines drawn from similar numbered intersections on the miter line B E at right angles to B C. Trace a line through the points thus obtained, as shown by 1 M N O 1, which is the desired pattern. Should an elbow be desired where the oval I J G H is in a vertical position in plan, then use the same principles as here given.

EXHAUSTIVE QUESTIONS ON HEATING.

From C. C. C., Sacketts Harbor, N. Y.—We have request for the information necessary for calculating or estimating on heating requirements, as follows:

Estimating the number of square feet of radiation required in a room or building for direct steam heating.

Estimating the number of square feet of radiation required in a room or building for indirect steam heating.

Estimating the number of square feet of radiation in a room or building for direct-indirect steam heating.

Estimating the number of square feet of radiation required in a room or building for direct hot water heating.

Estimating the number of square feet of radiation required in a room or building for indirect hot water heating.

Estimating the number of square feet of radiation in a room or building for direct-indirect hot water heating.

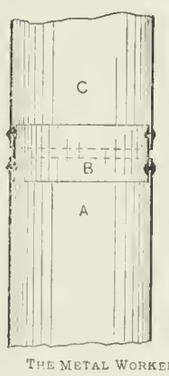
Estimating the size of pipe and register required for heating a room with warm air.

Estimating the size of furnace, area of cold air box, length and size of pipes and size of registers required for heating a building with warm air.

Estimating the additional requirements if the building is to be ventilated and the air to be changed any number of times per hour.

Estimating the size of ventilating shaft required, if the cubical contents of the room is known, for each specified number of times that the air is to be changed.

Note.—To adequately answer the questions presented by this correspondent would require far more space than is available in the Letter Box. Moreover, information upon most of the heads presented has been the subject of special articles in our columns within a comparatively recent period. By looking over the back numbers of *The Metal Worker* "C. C. C." will find detailed answers to all of these questions. Should he not have these back numbers to refer to, he will find it of benefit to secure some of the standard books on the heating of buildings which have been prepared by different authors.



In this connection we would remind our readers of the desirability of preserving the copies of *The Metal Worker*. By consulting the files of the paper, which can be done readily with the help of the semiannual index, they will very frequently be able to secure assistance in regard to problems they may meet with in the course of their work. Should they be located near any of our branch offices, they can always find there files of *The Metal Worker* for reference.

Meantime, we shall be glad if any of our readers will lend such assistance as they can to our correspondent by giving the rules which they use on such work as is outlined in his questions. The questions presented cover a wide field and answers to them will doubtless be of as wide an interest.

SMOKE STACK PATTERNS.

From R. J. B., Mt. Vernon, Ind.—Will you please inform me how to lay out smoke stack patterns of No. 12 or 14 gauge iron, so that when all the up and down seams are all on one side the stack will be straight?

Answer.—We would suggest that our correspondent put a separate collar in each joint, as shown in the accompanying sketch, in which A shows the first joint and B the collar riveted as shown. Then C, the second joint, is slipped over the collar and riveted to same, thus making a butt joint, which insures a perfectly straight line. Another way would be to taper the joints slightly at the top to allow the following joint to slip over. In obtaining the pattern for the joints multiply the inside diameter of the pipe by 3.1416, or 3 1-7, which is generally used in practice, and add seven times the thickness of the metal in use to the stretchout of the pattern.

Smoke Stack Pattern.

PATTERN FOR ELBOWS.

From W. C., Brooklyn, N. Y.—Will you please let me know through *The Metal Worker* how to lay out elbows having any angle?

Answer.—If our correspondent will refer to problems 38, 39, 40, 41, 42, 43, 44, 45 and 47 in "The New Metal Worker Pattern Book" he will find the methods of laying out elbows of any angle very thoroughly explained; while in *The Metal Worker* of May 4, 1901, on page 46, the rule is shown for laying out any pieced elbows with the various degrees on their miter lines.

INFORMATION ABOUT A SUN MOTOR.

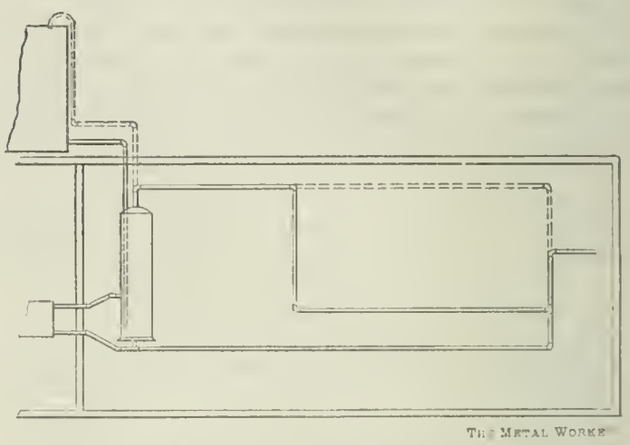
From the Sun Mfg. Company, Greenfield, Ohio.—We noticed in a recent issue of *The Metal Worker* an inquiry by "G. K." of Erie, Pa., for information regarding a sun motor that has been set up and run in California. We manufacture a motor for certain purposes, and would be glad to communicate with your correspondent.

POOR DRAFT IN STONE CHIMNEY.

From F. H. W., Parksville, N. Y.—I have been a reader of *The Metal Worker* for 17 years and would like to have the following letter presented in your worthy columns: I have cured many faulty chimney drafts by the use of many different chimney tops, but am now confronted with a chimney upon which I, as well as many others, have tried every scheme imaginable and have used many of the best-known chimney tops and ventilators on the market without success. The chimney is built of stone, on the outside of a church, and extends 7 feet above the building. Upon the advice of some I have extended an iron pipe through the entire length of the chimney. This proved fruitless, as did also the scheme of changing the size of the flue. The chimney is 75 feet distant from the spire and has a flue 11 x 14 inches. There is a boiler connected with the chimney

Poor Draft in Stone Chimney.

by means of a 9-inch smoke pipe. The boiler has a grate surface of 4 x 2 feet. If any of the readers of *The Metal Worker* can give me advice as to how to overcome the trouble I shall be glad to hear from them.



LARGER HOT AIR PIPES.

From Lennox Machine Company, Marshalltown, Iowa.—We notice the letter of "M. Y." in *The Metal Worker*, December 28, regarding size of hot air pipes. This is a matter that we have been debating in our own mind and find that there is room for argument on both sides. It is certainly true that a furnace will last better and is less likely to be overheated if the hot and cold air pipes are large, allowing a quick passage of the air over the surface. On the other hand, as somewhat of an experiment, in our own house we have been using small pipes and registers. We have but one 10-inch pipe in the house, and we find that under all conditions of the fire, any of the registers will respond quickly when opened. We think that they respond much quicker than they would if a portion of the pipes were 12 inches in diameter. We believe this is especially true in moderate weather with low fires, for where large pipes are used there is more chance for one, two or three of the pipes carrying all the air that is being warmed, and at the expense of some less favorably located register and pipe.

In regard to "M. Y.'s" inquiry as to the best location for registers in a church where but one register is used for hot air, we would think that the best place would be far enough in front to be on the lowest part of the floor. Not so much on account of making a difference where the heat comes in, but on account of being able to get short connections for the cold air registers and have them come over the low part of the floor. We think that a mistake is oftener made in the location of the cold air register faces in heating a church than in the location of the hot air register. An important thing, especially in a church furnace, is to have one of ample size, as there is a large volume of air to move and in order to move it quickly the furnace must have large capacity.

AIR BOUND; NEEDS RELIEF PIPE.

From W. W., Wyoming, Iowa.—I submit herewith a sketch of the piping to a 30-gallon boiler, which is placed in a small bathroom. Hot water can be drawn at the bib at the end of the circulating line, but as the water does not circulate, the pipe soon becomes cold. The pipe must be dropped in the corner, as shown, in

Air Bound, Needs Relief Pipe.

order to run below windows. The flow pipe is ¾ inch and the return pipe is ½ inch. I should be glad to know the cause of the trouble and how to overcome it.

Answer.—The trouble is due to the hot water pipe becoming air bound. All water contains more or less air, and, when liberated, the air will accumulate in the pipe unless some provision is made for its escape. If a small pipe is run from the highest point in the air locked pipe, as indicated by the dotted lines at the top of the boiler, and carried over to the tank, and then the end turned down over the top of the tank the air will have an opportunity to escape. The circulation will be more rapid and better if the same size of pipe is used on the return as is used in the flow, in this instance, owing to the fact that the hot water must cool and fall to secure a circulation.

PAINT FOR GALVANIZED IRON.

From New Process Mfg. Company, Dallas, Texas.—We notice in your issue of November 30, 1901, an inquiry from "B. B. C.," Temple, Texas, for a paint that will stick to galvanized iron, and would say that we have been making a paint for five years that will not scale off galvanized iron, and which is the only paint we have ever found that would not do this. We use this in painting the bells of our acetylene gas machines that work up and down in the water, and, notwithstanding being permeated with acetylene gas, the paint remains intact, so far as we have been able to ascertain. We have used it with other iron, as well as galvanized, and have failed to get it off with sulphuric, carbolic or muriatic acid. It has also stood the test of being boiled in strong brine.

PATTERN FOR ROOF FLANGE.

From J. L., New Brighton, S. I.—Will *The Metal Worker* kindly explain how to describe the pattern for a flange piece around a round pipe, passing through the center of a gable roof?

Answer.—On page 128 of "The New Metal Worker Pattern Book" Problem 36 shows the pattern which our correspondent desires. In *The Metal Worker* of August 3, 1901, on page 53, the rule for obtaining the pattern for roof flange was given, the principles of which can be applied to our correspondent's problem.

MAUPIN BROS. are carrying on the Hardware, Stove and Farm Implement business formerly conducted by C. C. Maupin, Calhoun, Mo.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is about ¾c. higher, but is quiet.

Copper has declined ¾c. further, and the market is demoralized.

Pig Lead is dull and unchanged.

Spelter continues dull, but without change.

Hallett's Antimony is a shade lower; Cookson's unchanged.

Nickel, in large lots, is lower, but retail prices are unchanged.

Aluminum is active, at former prices.

Tin Plates are quiet; jobbers' prices have weakened somewhat.

Sheets are still in large demand and market is strong.

Sheet Copper is very dull, with outlook for lower prices.

Sheet Zinc is in moderate demand; prices unchanged.

Pig Iron is very active and strong; Foundry Pig rules 50c. higher.

Scrap Iron is active and firm.

Scrap Brass and Copper are weak and lower.

Stoves in New York have been advanced 5 per cent. in price.

Soldering Coppers have been marked down 3c.

Lead Pipe is down ¼c.

Tobin Bronze Rods have been reduced in price.

Copper Wire is lower.

Wire Nails have been advanced 5c. per keg.

Cut Nails are firm and fairly active.

Copper Rivets and Burrs have been reduced 10 per cent. in price.

Cast Iron Soil Pipe and Fittings are likely to advance 5 to 10 per cent.

Plumbers' Brass Work has been reduced in price from 5 to 10 per cent.

Lead Traps and Bends have been marked down 10 per cent.

White Lead is weak and unsettled.

Linseed Oil is unchanged and quiet.

Spirits Turpentine is strong and about 2c. per gallon higher.

METAL MARKET.

NEW YORK, January 17, 1902.

Pig Tin.—Since the date of our last report, the Pig Tin market has become somewhat firmer, but it is still very quiet as far as transactions are concerned. Prices here are about ¾c. higher than those ruling a week ago. Straits Pig, in small lots, is now quoted by jobbers at 24½c. to 25c. per lb. Buying is still being done on a very limited scale, and only for immediate consumptive requirements, and speculative business is virtually absent. The market closed with a firm tone, both here and in London.

Copper.—The week under review has witnessed further reductions in the price of Copper, and consumers are not yet satisfied that the bottom has been reached. The United Metals Selling Company have decided not to announce "official" prices hereafter, and are selling at figures to meet the market. Since this announcement was made the cutting of prices has continued in a steady fashion, involving sharp declines. Wholesale business is now being done on the basis of 11c. for Lake Ingot. The amount of business, however, is very small, transactions being only of a retail character. Lake Ingot, in small lots, is now quoted by jobbers at about 11¾c. to 12c. per lb., and Casting Copper at 11¼c. to 11½c. A sharp advance in Copper in London on Thursday caused some surprise, but it was generally assumed that the rise resulted from speculative manipulation.

Sheet Copper.—But little buying of Sheet Copper is being done, notwithstanding the reduction of 3c. in price made recently. Consumers appear to be impressed with the conviction that a further cut in the price of Sheet Copper, in correspondence with the continued decline in the raw material, will be announced shortly; consequently they are buying only to the limit of their immediate requirements. The present base price of Sheet Copper is 18c. per lb.

Pig Lead.—No change is noted in this market, which is very quiet, business being on a small scale. Prices are without variation, American Pig in small lots being quoted by jobbers at 4.40c. to 4½c. per lb. St. Louis advices report some business being done in Pig Lead in that market, but the volume is not heavy. Prices show no change.

Spelter.—An easier tone was developed in this metal in the early part of the week, but the market stiffened up at the close, although business was far from brisk. Jobbers quote good Western brands in small lots at 4⅝c. to 4¾c. per lb. St. Louis advices report trade on a light order in that market and prices without quotable change.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions. Jobbers quote 600-lb. cask lots at 6¾c. and smaller quantities at 7¼c. per lb.

Antimony.—A slight decline in Hallett's was noted this week, but not sufficient to affect the retail prices, which continue at 8¼c. to 8¾c. per lb. for Hallett's in small lots, with U. S. at the same prices and 10¼c. to 10¾c. for Cookson's.

Nickel.—No change has taken place in this metal so far as retail prices are concerned, they continuing on the basis of 60c. to 65c. per lb. It is said, however, that new contracts for large lots are being made on a materially lower basis.

Aluminum.—A continued active and steady demand for this metal is noted. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—There is no change to be noted in connection with this market. Large business is rather quiet, although the American Tin Plate Company are understood to have booked some good sized contracts for deliveries in the second half of the year. The retail trade is fairly active for the season. Jobbers' prices are said to have been cut in some directions, but they are pretty well up, as a rule, in view of the comparatively light condition of stocks available for spot delivery. American Bessemer Coke Plates, I C, 14 x 20, small lots, delivered at New York and corresponding points, rule at about $4.90 to $5.15 per box.

Sheets.—Orders for both Black and Galvanized Sheets are being received at the mills in considerable volume, and the tone of the market is strong. The mills have a great deal of work on hand and are still behind on their deliveries. It is not thought likely that prices will be any higher than they are at present, however, as so many independent mills have come into the market recently, or will be coming within a short time. These new concerns are actively seeking business, and the competition created will naturally serve to discourage any marking up of prices. The demand from small consumers in the New York territory is of good proportions and serves to pretty well absorb all the shipments that arrive from the mills. Jobbers' prices are firm and unchanged, No. 27, One Pass Cold Rolled Soft Steel Sheets in small lots being quoted at about 4c. to 4.05c., and Galvanized Sheets at 65 per cent. to 67½ per cent. off the list.

Chicago advices are as follows: Black Sheets are

not yet in oversupply. The standard mills are apparently well filled with work and the small independent mills seem to be less anxious for business, notwithstanding the fact that this is the dull season with many branches of the Sheet consuming trade. Jobbers report a fair demand from store. Small lots of No. 27 Black Sheets are quoted at 3.40c. to 3.50c. and Galvanized at 70 to 70 and 5.

St. Louis reports as follows: Activity rules in the market for Sheets and the tone is very strong and firm. Jobbers quote Stove Pipe size, No. 27, at 3.45c. to 3.50c., and Galvanized Sheets at 65 and 10 off.

Old Metals.—Scrap Iron is active and firm in price, but little is being done in Old Metals of other kinds. Scrap Brass and Copper are lower. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	9½c.
Light and Tinned Copper	per lb.	7¾c.
Heavy Brass	per lb.	7¼c.
Light Brass	per lb.	5¾c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3½c.
Zinc	per lb.	3 c.
No. 1 Pewter	per lb.	15¾c.
No. 2 Pewter	per lb.	8 c.
Tin Plate Scrap, per gross ton	to	$5.00
Wrought Iron Scrap, per gross ton	11.00 to	11.50
Heavy Cast Scrap, per gross ton	10.50 to	11.00
Stove Plate Scrap, per gross	8.00 to	8.25
Burnt Iron, per gross ton	5.50 to	5.75

THE PIG IRON MARKET.

New York.—The market is strong, but not specially active in this section. The good position of Pig Iron is encouraging the starting of additional plants. There has been considerable activity lately in Basic Pig, some of the Southern producers having sold round lots. We quote for Northern Irons: No. 1, $16.50 to $17.50; No. 2 X, $16 to $16.50; No. 2 Plain, $15.50 to $16; Tennessee and Alabama brands, No. 1 Foundry, $16.25 to $16.75; No. 2 Foundry, $15.75 to $16; No. 1 Soft, $16.25 to $16.75; No. 2 Soft, $15.75 to $16; No. 3 Foundry, $15.25 to $15.50; No. 4 Foundry, $14.75 to $15.

Chicago.—Vigorous buying is in progress. Heavy sales have been made for delivery during the last half of the year, and the local furnace companies have booked large contracts for these deliveries at advanced prices. This seems to indicate that consumers of Iron feel confident that values will not shrink to any extent this year. Some large business is under negotiation and a very heavy demand is noted for spot Iron for early delivery. Spot Iron readily brings $1 more than regular quotations on Foundry grades. The Southern furnace companies are booking a great deal of this business. The Coke situation has not yet grown much better. The output of local Iron is still greatly restricted. We quote as follows:

Lake Superior Charcoal	$19.50 to	$20.25
Local Coke Foundry, No. 1	16.50 to	17.00
Local Coke Foundry, No. 2	16.00 to	16.50
Local Coke Foundry, No. 3	15.50 to	16.00
Local Scotch, No. 1	16.50 to	17.00
Ohio Strong Softeners, No. 1	17.60 to	17.85
Southern Silvery, according to Silicon.	16.90 to	17.15
Southern Coke, No. 1	16.40 to	16.65
Southern Coke, No. 2	15.65 to	15.90
Southern Coke, No. 3	15.15 to	15.40
Southern Coke, No. 1 Soft	16.40 to	16.65
Southern Coke, No. 2 Soft	15.65 to	15.90

Philadelphia.—It is difficult to give anything like close quotations at the present time. The lowest price within a day or two for No. 2 X Foundry was $16.50, Philadelphia, and the highest is said to have been very close to $18, the latter for lots of several hundred tons each. These cases are a fair illustration of the difficulty in giving close quotations, although it is probable that $16.75 to $17.25 would be a fair average at this writing. Prices may go a little higher. Some think that $18 will be reached within 30 days, but more are of the opinion that prices are high enough, and that with a return to normal conditions in the matter of Coke and railroad facilities prices should begin to ease off a little. The Coke situation is improving and cars are less difficult to secure, but there is still a great scarcity of motive power. The indications at the present time seem to favor better conditions in this respect in the near future. Quotations cover a wide range, but for Philadelphia and nearby deliveries the following are as near as can be ascertained: No. 1 X Foundry, $18 to $18.25; No. 2 X Foundry, $16.75 to $17.25, and No. 2 Plain, $16.25 to $16.50.

Pittsburgh.—The purchase of 100,000 tons of standard Bessemer Pig Iron by the United States Steel Corporation, for delivery in April, May and June, and of 6000 tons by another Steel interest, together with heavy sales of Foundry Iron, has put the Pig Iron market on such a firm basis as insures beyond question the continuance of present conditions, at least through the first half of this year. All the Iron the furnaces can make in the first quarter is under contract, as well as a large part of the output for the second half. This probably means that furnaces will charge higher prices for small lots of Iron for prompt delivery. Sales of Northern brands of No. 2 Foundry Iron, for delivery the second half of the year, have been made on the basis of $16.50, Pittsburgh, and for prompt delivery $16.75 to $17 has been done. We quote standard Bessemer Pig Iron at $16.50 to $16.75; No. 1 Foundry, $17 to $17.50, and No. 2 Foundry at $16.50 to $17, all f.o.b. Pittsburgh.

CHICAGO REPORT.

Scrap Iron and Steel.—As the consumption is large, the movement is growing and prices are well maintained. All classes of Scrap are now in good demand. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.	
Country Wrought Scrap	$11.00 to	$11.50
Machinery Cast	10.50 to	11.00
Malleable Cast	10.00 to	11.00
Stove Plate (free from burnt)	8.00 to	8.50
Burnt Iron and Grate Bars	5.50 to	6.00
Sheet Iron and Hoops	6.00 to	7.00
Plow Steel	.... to	7.00
Breaking Stock	9.00 to	10.00
No. 2, such as Shovels, Hoes, &c	.... to	7.00
Old Boilers—whole (Iron)	6.50 to	7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to	11.00
Old Gas Pipes and Boiler Tubes	10.50 to	11.00
Cast Borings	4.50 to	5.00
Turnings	9.50 to	10.00
Horseshoes	12.00 to	....

Old Metals.—Prices of Old Copper and Brass have been marked down another notch, to conform to the drop in Ingot Copper, and trade is very limited. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	9¼c.
Copper Bottoms	7¾c.
Copper Clips	9 c.
Red Brass	8⅞c.
Yellow Brass	7 c.
Red Brass Borings	8½c.
Yellow Brass Borings	6 c.
Light Brass	5½c.
Pipe Lead	3.65c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.

Old Rubber.—Business continues dull. Consumers are holding off and stocks are increasing. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6½c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6¾c.
Black Rubber	....	4½c.
White Rubber	....	8¼c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—Only a moderate demand is reported, another week of mild weather prevailing in this territory. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

R. A. Zoeller, Tarboro, N. C., advises us that he is adding to his retail Stove, Hardware, Tinware and House Furnishing Goods business a tinning and plumbing shop. Mr. Zoeller will be glad to receive catalogues from the manufacturers and dealers in Plumbers' and Tinners' Supplies.

THE HARDWARE TRADE.

Manufacturers in some lines report an exceptional volume of new business since the opening of the year. This is notably the ease in Wire and Wire Nails, and for some other goods there has been a very satisfactory demand. The trade in general have not, however, taken up the completion of their ordering for stock, and the volume of business accordingly has not assumed its natural dimensions. The buying for several of the season lines and for miscellaneous goods was in many cases done earlier than usual owing to the confident tone which pervaded the market during the closing months of the year, and the requirements for the early part of the present year were thus in good part sufficiently covered. Manufacturers are not unwilling thus to have an opportunity to complete their assortments and to get their warehouses at least in part filled. The general feeling is that the volume of business is going to be large, and preparations are being made by both the wholesale and retail trade to lay in a good supply of goods.

The strength in the iron market, which seems assured for some time to come, gives tone to values in the manufactured products, and indicates that with a continuance of active business prices will be generally maintained. Certain lines owing to special influences are subject to suspicion. The competition of outside manufacturers is having effect on combination prices in several lines, and it may be that there will be some irregularities in such cases. Concerning one line, in which prices are very unsatisfactory, yielding little if any profit, one of the manufacturers intimates facetiously that cost and selling price are so nearly alike that it is difficult to distinguish one from the other, and adds pathetically that unless there is some understanding between manufacturers the only hope for improved conditions is that the buyers will grow sympathetic witnessing the manufacturers' distress and insist on paying higher prices. While this is an extreme case and manufacturers generally give a much more cheerful report, there is no doubt that the margin of profit on many goods which are regarded as bringing good prices is much less than it is supposed to be. This is on account of the rise in the cost of the raw material, the difficulty of obtaining it, and especially the fact that wages are gradually creeping up. This influence has had the effect of making last year's business with some manufacturers less remunerative than it should have been in view of its volume and the generally excellent condition of the trade. This increased cost of producing goods is an important factor in the situation, and argues at least for the maintenance of values while existing conditions continue. Reports from the retail merchants, whose business is the real barometer of trade, are, on the whole, very satisfactory, and indicate a large movement of goods during the first half of the year, if not into the fall and winter months.

NOTES ON PRICES.

Cast Iron Soil Pipe and Fittings.—There is an impression in the trade which is said to be based upon authoritative grounds that Cast Iron Soil Pipe and Fittings will undergo an advance of from 5 to 10 per cent. within the next few weeks. It is not known at the present time to what degree the entire line of goods will be advanced, but there is a general opinion that Extra Heavy Pipe will almost certainly be changed. Light Pipe is also likely to undergo a change, and the trade would not be surprised if Fittings, both Standard Weight and Extra Heavy, were also advanced sympathetically. It is known in the supply trade that this change is pending, and the jobbing trade are guiding themselves accordingly. The main reason for the expected advance is that Pig Iron costs to-day $2.50 more than it did when the prices now in effect on Cast Iron Pipe and Fittings were made. The year just closed has been the most satisfactory one that the manufacturers of this class of goods have known. All of the manufacturers of Cast Iron Soil Pipe are now in the association, and so far as can be learned no new foundries are contemplated. It is believed that no difficulty whatever will be experienced in maintaining an advance in prices provided the change is not of too radical a nature.

Plumbers' Brass Work.—The Manufacturers' Association of Brass and Iron Steam, Gas and Water Work held a meeting in Pittsburgh, Pa., on Tuesday, January 14, at which a new schedule of prices was adopted. These prices show a decline of from 5 to 10 per cent., according to the nature of the goods. The new schedule of prices is said to be based on the present price of Ingot Copper, and in the ratio of 70 pounds of Copper to 30 pounds of Alloy, plus labor and profit. It is the general opinion that if this is true, and the amount of profit is not exorbitant, the move on the part of the Price Committee of the association was a wise one, and that it will give the new prices a permanency which they otherwise would not have.

Lead Traps and Bends.—Under date of January 9, 1902, the discounts on Lead Traps and Bends, Combination Ferrules, Combination Soldering Nipples, Ferrules and Bends, Nipples and Bends and Lead Drum Traps underwent a decline of 10 per cent. discount to the plumbing trade. The plumbers' price is now 60 per cent. from United States Standard price-list which was issued June 30, 1901. As this change is said to have been brought about through a quarrel among the manufacturers, it is believed that the present price is not likely to last very long. Efforts are now being made to patch up the differences, and as soon as this is settled prices are likely to revert to previous quotations.

Lead Pipe, Sheet Lead, &c.—Under date 13th inst. a reduction in the price of Sheet Lead, Lead Pipe, &c., is announced by the manufacturers. Following are the present prices, which are subject to the usual discount to the trade of 20 per cent., 1 per cent. for cash in ten days being allowed and freights equalized with nearest manufacturing point:

	Per pound.
Lead Pipe	6½c.
Sheet Lead	7¼c.
Tin Lined Lead Pipe	12½c.

Copper Rivets and Burrs.—In view of the condition of the Copper market and the development of lower prices, the trade are watching closely the market for Copper and Brass Sheets, &c., but thus far there has been no further decline in these goods. A reduction, however, of about 10 per cent. has been made in the price of Copper Rivets and Burrs, of which, it is understood, manufacturers have a large stock on hand. The manufacturers are pursuing a conservative course in announcing changes of price in Copper products, and are awaiting the developments of the market for Ingot Copper, in which a stable price will probably be developed before long. Lower prices are, however, ruling for Copper Wire, bare and insulated.

Tinware.—A good deal of interest has of late been taken by the trade in the condition of the Tinware market, in which, as a result of the good understanding between the manufacturers, it has been expected that some advance in prices would be announced during the present month. This action has not yet been taken, but it is understood that a very harmonious meeting of the leading manufacturers was held in this city during the present week, as a result of which the continuation of the association is assured. Some consideration was given to action in regard to prices, but nothing definite was accomplished in this direction. The excellent relations which at present exist between the prominent manufacturers in this line give promise of regularity in prices, thus correcting a condition of things which has often characterized the Tinware business.

Wire Picture Cord.—This is a line which must be bought carefully, in view of existing confusion in regard to list prices, the diversity of discounts which are current and the fact that there is more or less departure from standards in the matter of length and count of Wires. Thus a package marked 25 yards should contain 25 yards and should be properly numbered, when, in matter of fact, some Wire is put up short length and is marked up in number, as, for example, No. 2 is called No. 3, No. 3 is called No. 4, &c. These differences in the goods have something to do with the diversity of discounts which are prevailing.

Soldering Coppers.—The radical decline in Ingot Copper has affected the price of Soldering Coppers very materially. These goods are now being sold in small lots at 17c. to 18c. per pound, whereas they fetched from 22c. to 23c. previous to the slump in Copper.

Building Papers.—There are no changes in the market for this line of goods, prices being substantially maintained at previously published figures for Tarred Roofing, Sheathing, Slaters' Felt and Deadening Materials. Business continues good and of satisfactory volume.

Pumps.—The manufacturers regard the prices which are ruling for Pitcher Spout Pumps as being too low, in view of the condition of the iron market and the excellent demand for the goods. The matter of making an advance will probably be considered.

Tobin Bronze Rods.—Under date January 3 the Ansonia Brass & Copper Company, New York, announce the following revised net prices of Tobin Bronze Rods:

Round Rods for Studs, Bolts, Forgings, &c., Ordinary Lengths.

⅝ inch to 3 inches diameter, both inclusive, 17c. per pound net.
Less than ⅝ inch and not less than ⅜ inch diameter, 18c. per pound net.
Less than ⅜ inch and not less than ¼ inch diameter, 20c. per pound net.
Less than ¼ inch and not less than ⅛ inch diameter, 27c. per pound net.

Pump Piston Rods and Yacht Shafting.

	⅝ inch to 2½ inches diameter, both inclusive. Pound net.	Over 2½ inches and not over 5 in. diameter. Pound net.	Less than ⅝ inch and not less than ⅜ inch diameter. Pound net.
Longer than 12 inches, not longer than 120 inches..	18c.	20c.	21c.
Longer than 120 inches, not longer than 180 inches..	20c.	22c.	...
Longer than 180 inches, not longer than 216 inches..	21c.	23c.	...
Longer than 216 inches...	27c.	29c.	...

Furnace Fittings.—The S. M. Howes Company of Boston, Mass., announce under date of January 7, 1902, a reduction in the price of their Furnace Fittings to 30 per cent. discount from the list price in their catalogue, dated September 15, 1901, pages 12 to 20.

Wire Nails.—At a meeting of Wire Nail and Wire manufacturers at the Hotel Lincoln, Pittsburgh, on Tuesday, the minimum price of Wire Nails was fixed at $2 a keg in carloads, Plain Annealed Wire at $1.95 and Galvanized at $2.35 per 100 pounds. The new price of Wire Nails is an advance of $1 a ton. Contracts are being booked quite freely for deliveries during January and February, while the current demand for small lots is good for the season. With the general withdrawal of the low prices recently obtainable the market is in a decidedly better state than a week ago. Small lots from store, New York, are quoted at about $2.30 to $2.35 per keg.

Cut Nails.—The market for Cut Nails is firm, with a fairly satisfactory demand for the season. The scarcity of Steel and the low price of Wire Nails is restricting the distribution of Cut Nails. In the New York market represetatives of the mills are adhering to the price of $2.35 for Nails from store. Jobbers are asking the same price generally, but in some instances are selling 2 cents below these figures.

White Lead.—The market for White Lead in Oil is in an unsettled condition, owing to keen competition. Although quotations were lowered during the latter part of December, orders are being accepted by manufacturers, it is reported, at ¼ to ½ cent below current quotations. Retail quotations, however, remain unchanged at 6½ to 6¾ cents per pound.

Linseed Oil.—The Flaxseed market fell off sharply at the end of last week, but has moved up again slightly, and the reaction in the Seed market, together with lack of interest on the part of Oil buyers, has had a depressing effect upon Linseed Oil. Consumers' requirements appear to be fairly well covered. City Raw Oil is quoted at 62 to 63 cents in small lots. Boiled Oil is 2 cents advance on Raw.

Spirits Turpentine.—The Turpentine market has been strong, with an advancing tendency during the week. Reports from the South indicate a strong feeling of the probability of a reduced production in the coming crop. The local demand is comparatively light and the market firm. Turpentine in small lots is quoted at 41 to 41½ cents per gallon.

Ripley Hardware Company, Grafton, Ill., have issued a catalogue of 64 pages, illustrating and describing the company's line of Feed Cookers, Sprayers, Whitewashing Machines, Steel Tanks and Fancy Poultry, Cattle and Sheep Breeders' Supplies.

Rollman Mfg. Company, Mount Joy, Pa., are sending out a postal circular calling attention to the merits of their Rollman Cherry Seeder, which is referred to as a practical machine for seeding large, small or California cherries.

Charles C. Stelle, 81 Fifth avenue, Brooklyn, N. Y., has issued a circular describing Post's Improved Eureka Sap Spouts with patent air trap, of which he is manufacturer.

Soper & Reid have succeeded R. J. Soper in the Hardware, Stove, Tinware and grain and seed business in Lebo, Kan.

A. L. Tuttle, Berwick, Maine, has moved his Hardware, Stove and House Furnishing Goods business to new and more commodious quarters.

Eastern Office, 284 Pearl St., NEW YORK. 217 North Union St., CHICAGO, ILLS., U.S.A.

CLASSIFIED LIST OF ADVERTISERS.

Acetylene Gas Burners.
Carroll, J. B., Chicago, Ill.

Acetylene Gas Generators.
International Heater Co., Utica, N. Y.

Aluminum Ingots.
Janney, Steinmetz & Co., Phila., Pa.

Alaminum Scrap Buyers.
Janney, Steinmetz & Co., Phila., Pa.

Alaminum Sheets.
Janney, Steinmetz & Co., Phila., Pa.

Architectural Ornaments.
Edwards Mfg. Co., Covington, Ky.
Frand, Martin J. & Co., Camden, N. J.
Friedley & Voshardt, Chicago, Ill.

Ball Cocks
Foster, F. W. Mfg. Co., Boston, Mass.

Bathtubs.
Day Metallic Mfg. Co., Detroit, Mich.

Black Plates.
American Tin Plate Co., New York.
Taylor, N. & G. Co., Phila., Pa.

Boilers
Mueller, L. J. Furnace Co., Milwaukee, Wis.

Boilers, Range.
Koven, L. O. & Bro., 50 Cliff St., N. Y.
Wolff, L. Mfg. Co., Chicago, Ill.

Brass Goods
Jenkins Bros., 71 John St., N. Y.
Zero Valve & Brass Mfg. Co., Buffalo, N. Y.

Burners, Acetylene.
Carroll, J. B., Chicago, Ill.

CanMakers' Tools and Machines.
Bliss, E. W. Co., Brooklyn, N. Y.
Niagara Machine & Tool Wks., Buffalo, N. Y.
Robinson, J. M. Mfg. Co., Cincinnati, Ohio.
Stiles & Parker Press Co., Brooklyn, N. Y.

Castings, Iron.
Cheney, S. & Son, Manlius, N. Y.

Caterpillar Destroyers.
Williamson, R. B., Clifton Springs, N. Y.

Ceilings, Metallic.
Berger Mfg. Co., Canton, O.
Canton Steel Roofing Co., Canton, O.
Bowman Mfg. Co., Atlanta, Ga.
Eller, J. H. & Co., Canton, O.
Friedley & Voshardt, Chicago, Ill.
New York Iron Roofing & Cor. Co., Jersey City, N. J.

Cellar Drainers.
Kemp, C. M. Mfg. Co., Baltimore, Md.

Coal Vases.
Cincinnati Stamping Co., Cincinnati, Ohio.

Coils.
National Pipe Bending Co., New Haven, Conn.

Conductor Pipe and Elbows.
Berger Bros. Co., Philadelphia, Pa.
Clark, Quien & Morse, Peoria, Ill.
Lawrence-Letts Elbow Co., Ltd., Waverly, N. Y.
McClure & Co., Pittsburgh, Pa.
Marlin & Co., Pittsburgh, Pa.

Copper, Roofing and Cornice.
Gummey, McFarland & Co., Phila., Pa.

Cornice Machinery.
Double Truss Cornice Brake Co., Buffalo, N. Y.
Keene, Geo. C. & Co., Cincinnati, O.
Niagara Machine & Tool Works, Buffalo, N. Y.
Ohl, Geo. A. & Co., Newark, N. J.
Peck, Stow & Wilcox Co., 27 Murray St., New York.
Phila. Machine Tool Co., Phila., Pa.
Poorman Mfg. Co., Piqua, O.
Robinson, J. M. Mfg. Co., Cincinnati, Ohio.

Cornice Work, Galvanized Iron.
Garry Iron & Steel Co., Cleveland, O.

"Qualified," care *The Metal Worker,* 117-119 South Fourth street, Philadelphia, Pa. Jan. 11

To The Trade:

On Aug. 3, 1901, the factory of George R. Moon, manufacturer of Moon's Ovens, at Columbus, Ohio, was destroyed by fire.

For years the "Moon" vapor ovens have borne the reputation of being the very best on the market and we take great pleasure in advising the trade that we have secured exclusive control of Mr. Moon's patents and have begun extensive preparations for the manufacture of these ovens in large quantities, and shall use our best efforts to maintain their excellent reputation.

We expect to be able to make shipment in ample time for the spring trade and respectfully solicit your patronage. Very truly yours,

THE WONDER MFG. CO.,
Washington C. H., O.

Visiting Briton (also a golfist): "Ah, that was a bunker, to be sure."—*Exchange.*

— SPEAKING CLOCK.—An Austrian inventor has just patented a speaking clock which he claims will be of the greatest value to persons of forgetful and irregular habits. It consists of a clock phonograph combination. In place of the regular striking attachment is a phonograph, which can be set to speak a sentence at any time desired, thus becoming an unfailing reminder to its owner of the duties of each successive hour.—*Ex.*

Are You Studying Your Best Business Interests. ?

Hardware Store Business Methods, now in its third edition, enlarged, is a useful hand-book for dealers, giving the most practical kind of information on store management, and treating subjects in which every hardwareman is vitally concerned. The book contains descriptions of methods successfully adopted by enterprising hardware merchants, and is designed as a guide and assistant for the merchant, the buyer, the salesman and clerk.

THE RANGE OF SUBJECTS IS INDICATED IN THE FOLLOWING LIST OF CHAPTER HEADINGS:

Rules and Regulations for the Hardware Store. The Hardware Buyer. Good Buying. Hints for Buyers. Securing the Correct Charging of Goods Sold on Credit. Conducting Sales to Avoid Oversights in Making Charges, Credits, etc. A Broad View of Stock Taking. Good Methods in Stock Taking. Suggestions in Regard to Inventory. A Price Book and Stock Directory. Prices and Catalogues. Arrangement of Catalogues and Price-Lists. The Accumulation of Dead Stock. The Treatment of Clerks. Waste in the Store and How to Avoid It. Keeping the Stock in Shape. Collecting Accounts. The Retail Hardware Merchant's Collections. Changing a Credit into a Cash Business. Sales Record of Cook Stoves. The Merchant and His Employees. How to keep the Store Neat and Clean. Cost Marks. Averaging Retail Profits. Changing Business Conditions and How to Meet Them. Starting in Business. Profit Figuring System.

Patent Pending.

Iwan's Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

1st. It holds pipe one inch from building to permit painting.
2d. It looks ornamental.
3rd. It can be used for frame or brick buildings.
4th. It can be used for round or corrugated pipe.
5th. It completely encircles the pipe, holding it firmly on all sides.
6th. It is strong and durable.
7th. It is cheaper than any other hanger.
8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwan's Chimney Top.

Like the "Old Style" Plates, the "Imitation" Charcoal Iron Plates bear a stamp on the sheet.

It's the only way to tell them apart. But the

ONLY GENUINE CHARCOAL PLATE made—

GUMMEY'S ANTI-PINHOLE,

may be told from all other plates without the stamp, for the simple reason that it is the only plate of its kind, viz.:—

ALL PURE CHARCOAL IRON.

Sold Only By

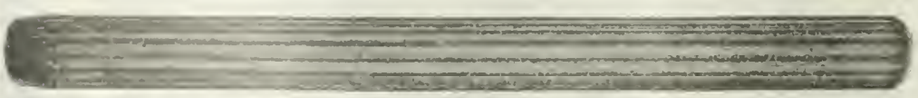
GENERAL OFFICES:

Battery Park Building, NEW YORK CITY.

A Few Points About The Dover Elbow:



No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe
It is handsome. It is strong. It is the best elbow on the market.

PLAIN TALKS ON METAL CEILINGS

Have you ever stopped to consider the advantage of handling metal ceilings? If not, you are neglecting something it would pay you to look after.

You figure on cornice work, roof work, siding and eavespouting—all kinds of **Exterior** sheet metal work—why not add the profitable line of **Interior** work to your list?

The erection of Sheet Me al Ceilings and Sidewalls is right in your line—you have the necessary experience to handle it properly and to good advantage. Moreover, it is work that often can be done when bad weather would not permit of working outside.

WE MAKE IT EASY TO FIGURE ON METAL CEILINGS.

Send us sketch and exact dimensions of room and of ceiling to be covered. We will submit sketch and prices of appropriate designs. You can easily determine the price you will have to get for the ceiling erected in place. There's no guess-work about putting up a ceiling—our construction drawing shows just where each piece of material belongs.

You may just as well get this class of work as not. Others are having great success in introducing and erecting our Metal Ceilings—why not you? Think it over. Write us.

Perhaps we can make suggestions that will be helpful to you.

The J. M. & L. A. OSBORN COMPANY,

COLUMBUS. *CLEVELAND.*

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

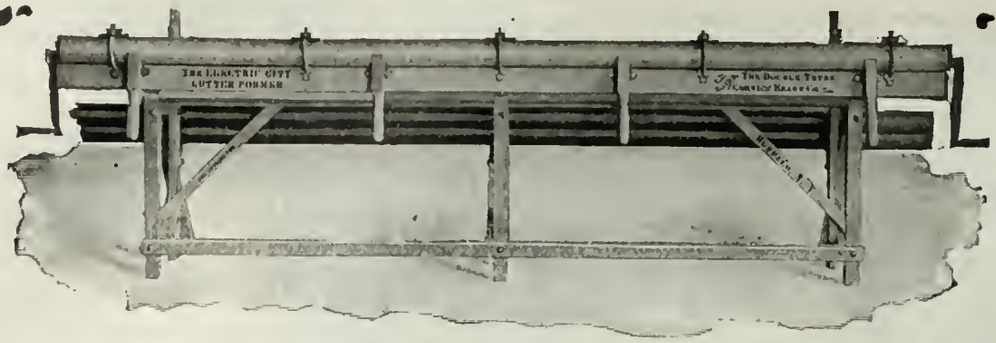
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.
This machine will do everything that can be accomplished by any other gutter former. No other machine can do quicker work.
The principle of this machine is entirely different from any other. It is more practical. Both the head and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.
Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD.

96 inches long.

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.

With Lever Arc, Automatic Gauge. Will cut No. 22 iron

97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

PRICE, - - $35.00.

ROUND OAK
STANDARD OF AMERICA

Haas & Huebsch, LeMars, Iowa, write us under date Aug. 7, 1901: "The new Round Oak Standard Cast Range is received, and we consider it the best piece of cast goods ever put on our floor." We know, of course, that the testimonial business has been worked overtime, but Mr. Haas wrote this of his own volition and he meant what he said. We believe that every stove merchant who likes to sell good goods, something a little better than the usual, would, after examining the Standard, say the same as Mr. Haas

QUICK MEAL

Gasoline Stoves.

SIMPLICITY has made the "**QUICK MEAL**" **popular** with the **trade.**

SIMPLICITY combined with **first-class materials** made by **first-class workmen** under the instruction of a **first-class designer,** is what has made and kept the "**Quick Meal**" **Evaporating Stoves** in the lead at all times.

SIMPLICITY has made the "**QUICK MEAL**" easy for the dealer to sell, easy for the user to understand and keep clean. That is why there are more "**Quick Meal**" **Evaporating Stoves** sold to-day than **all others combined.**

SIMPLICITY, DURABILITY AND APPEARANCE is what makes the "**QUICK MEAL**" the **leading gasoline stove.**

They are the profit makers.

P S.—"Quick Meal" Steel Ranges attract the Eye, please the Cook, and make Friends for the Dealer.

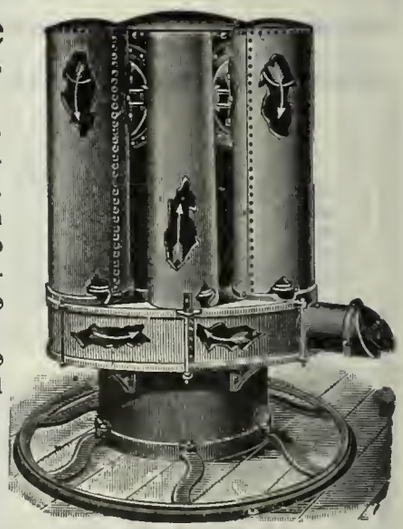
Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.



We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The ***American Furnace*** is made for the better class of trade; is durable, clean and economical in fuel.

The American Furnace Co.,

Reliable Vapor Stoves and Ranges for 1902.

DEALERS who are seeking a strictly high grade line of Vapor Stoves and Ranges that are standard the country over cannot afford to overlook our line. "**RELIABLE**" Stoves have the NAME and FAME as being the best and most successful to handle.

THERE are NONE better. A few are claimed as good. None as well and favorably known. Our reputation will not permit of our making any inferior goods. If you wish to control the Vapor Stove business of your city, secure the agency of the "**RELIABLE.**" They have proved profitable and satisfactory to thousands in the past, and will to you.

Our line for 1902 is larger and finer than ever. Send for our latest catalogue. It is yours for the asking.

MADE BY

The Schneider & Trenkamp Company,

CLEVELAND. CHICAGO. SAN FRANCISCO.

When You Talk...

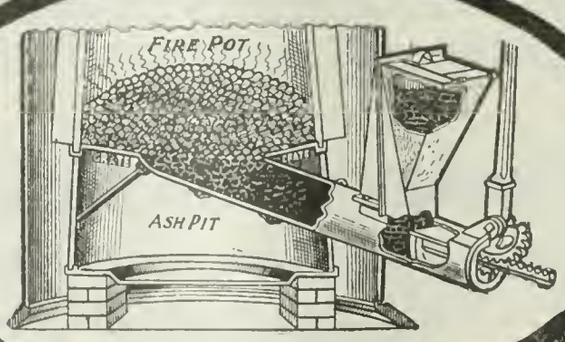
furnace to a customer you cannot reasonably expect him to drink in all you say as inspired truth.

It may be the truth, but that cuts no figure. It is what that customer believes down in his own heart that counts.

The Peck-Williamson Underfeed Furnace argues for itself. It shows by its construction precisely what it will do and why it will do it. Your customer can see it. He can't dodge it, in fact. The evidence is there before his eyes, and it needs no elaboration by word of mouth.

This furnace requires less fuel than any other. On top of that it gives more heat than any other. There is no way it can help but compass these two points. It is built expressly to do just that.

Mark this: In the ordinary furnace new coal is fed on top of the fire, and much of the products of combustion escape in the form of smoke.



Not so in the Peck-Williamson Underfeed Furnace, because the fuel is fed up under the bed of live coals and the escaping and volatile gases are obliged to pass through that bed of live coal. It is the only outlet and they are therefore burned. This not only prevents smoke, but saves an appreciable percentage of the heat units which are wasted through the chimney in the ordinary furnace.

Why not handle a furnace that will do its work and do its saving so noticeably as to excite comment? Do you suppose for a moment that the Peck-Williamson Underfeed Furnace would be built as it is if it were an experiment?

Our handsome new booklet tells the whole story. It is yours for the asking.

MILWAUKEE, WIS.

OLD LYME, CONN., January 15th, 1902.

DIGHTON FURNACE CO., Taunton, Mass.:

GENTLEMEN—I suppose it is time something was said about the "Dighton" Furnace in the Church at Old Lyme.

I am the Janitor of the Church and I must say your Furnace is giving great satisfaction, and I have no trouble in heating the building.

We have had some cold Sundays since the Furnace was put in, but I was able to keep the temperature over 70° without putting on any draft or pushing the Furnace any at all. I must say it is one of the best Furnaces I ever saw. It combines simpleness, cleanliness and efficiency which I think cannot be equalled by any other at present.

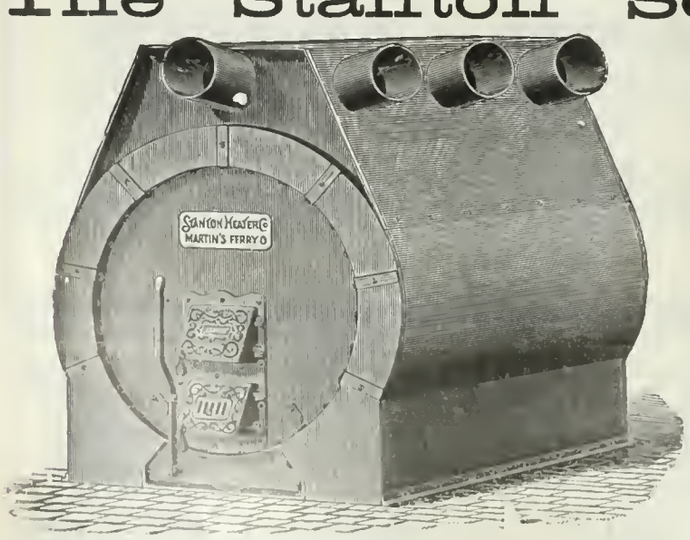
If I wanted to go into details about it, I could tell you some of the things it has done, but I will relate one: One Saturday night I did not put on a large fire, but just enough, I thought, to keep it going until morning. During the night a change came, and in the morning the wind was blowing a gale from the North, with the temperature 6° above zero and found the fire dead out and the Church temperature just 34°.

I dumped the fire and put on full draft, and by 11 o'clock, when service commenced, the temperature was 68°, and by 12 o'clock I had to open the doors. If this is any use to you as a testimonial do not hesitate to use it.

Yours respectfully,

JOHN KANE, Sexton Lyme Church.

Your Guarantee is Good,



If backed up by our line. We make many kinds and sizes of steam and hot water boilers, and you as a dealer ought to know all about this line. Let us send you our printed matter and post you on the standard line. Write to-day.

KEWANEE BOILER COMPANY

KEWANEE, ILLS.

The Stanton Seamless Heater,

PORTABLE CASED.

STATE COLLEGE, PA., June 15, 1900.

THE STANTON HEATER CO., Martin's Ferry, Ohio.

GENTLEMEN:—The Stanton Heater is giving the best kind of satisfaction. It will produce good heat from any kind of fuel. My average cost of fuel, per month, for the past winter was three tons of coal dust from soft coal to heat 43,000 cubic feet of space with a No. 68 Heater; however, this space is 3,000 cubic feet over the capacity of your Heater, but the heater did the work easy, and held the temperature in zero weather so it would not change over four degrees in twelve hours without touching the Heater.

The Stanton Heater is, in my judgment, the most modern and economical warm-air generator of this age.

Sincerely yours, J. N. KRUMRINE.

A NEW AND ENLARGED EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF PRACTICAL LETTERS AND ARTICLES RELATING TO WATER BACKS AND RANGE BOILERS.

The attention of readers of THE METAL WORKER is directed to the *fifth and enlargea edition* of Kitchen Boiler Connections, just published. Four editions of this practical book have been sold, giving apparently universal satisfaction, but with a view to presenting a more thorough treatise on the subject, and to enhance the value of the book to the Plumber, Architect and Mechanic, we have incorporated with this edition about sixty-five pages of new matter, together with over forty additional illustrations.

These additions cover many important phases of the subject not discussed in the earlier editions, giving practical solutions of numerous other problems often met with.

The new contents include among other important subjects:

In Chapter I. Kitchen Boiler Below Range.
" VI. Water Hammer in Boiler Connections.
" VIII. Proper Connection for a Horizontal Boiler.
" VIII. Double Water Back Instead of Double Boiler.
In Chapter VIII. Two Horizontal Boilers Connected with One Water Back.
" IX. Supplying Hot Water in Large Buildings.
" X. Lime Deposit.
" XII. Hot Water Supply and Heating a Barn.

Examples from actual practice only and which have arisen in the daily work of plumbers and pipe fitters are given in this book, which is therefore practical from beginning to end. Every mechanic, whether expert or novice, should have on hand for constant use or for reference a copy of this the new fifth enlarged edition.

It tells How to Connect Kitchen Boilers and Water Backs Under all Conditions.
It explains Remedies to apply to all kinds of Difficult Cases.
Heating from Kitchen Boilers is fully described.

194 Pages. Size 6 x 9 Inches. 113 Illustrations. Cloth Bound.

Price One Dollar, Postpaid.

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "*CONTRACT AND ESTIMATE RECORD BOOKS*" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

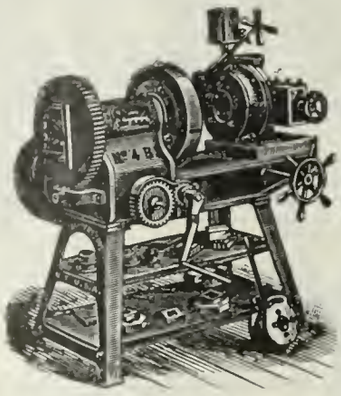
200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, $1.50

500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, $2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, $0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING



200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, $1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

The Stove Trade.

The condition of things in the stove trade certainly calls for congratulation, and should be satisfactory to the manufacturers. It will be noted, as recorded in the following pages, that there is a tendency to make reasonable advances in prices, which are certainly justified by the condition of the iron market, while their necessity is enforced by the balance sheets of some of the manufacturers. At the same time there is a disposition on the part of manufacturers who have not always worked in harmony to correct what have been disturbing influences in the trade, which have been attended at times with a good deal of demoralization. This is notably true of the New York market. It is fortunate that this condition of things exists at the present time, which is the dull season for sales, and that the season soon to open gives promise of not only a large volume of business, but of general conditions which should tend to make it profitable. The very moderate advances which have taken place will not in any way interfere with the business of the retailers and will undoubtedly meet with general approval.

Consolidation in the Stove Trade.

The present month has been fruitful of rumors of consolidation in the stove trade. The matter of combining several plants under one management for the purpose of reducing cost and increasing the efficiency of the selling force has been pretty thoroughly thrashed over in all sections where stove manufacturing plants are found, and the idea has received the approval of many prominent men in this branch of trade. While such a consolidation has been consummated in the gasoline and oil stove trade, nothing of the kind has as yet been accomplished among the manufacturers of coal burning goods. Apparently the rumor that six of the large Western plants would consolidate had some plausibility. Consultation with some well informed men, however, has disclosed the fact that less interest is being taken in the subject at the present time than was given to it a short time ago. At the same time some of the leading manufacturers favor the idea if it can be accomplished upon a hard pan business basis. Following the rumor of this Western consolidation scheme there was a report that efforts were being made to effect an Eastern consolidation of equal magnitude. While it is not difficult to discover Eastern manufacturers who favor the idea, evidence of a successful outcome in this direction is as yet lacking.

Open Market for Plumbing Goods.

The tension between the different interests in the plumbing trade as yet has not been relieved, desirable as a settlement of the differences would be to all concerned on account of the effect it may have on the business of the year. On the one hand there seems to be a strong feeling among the plumbers that their complaints and demands have not received at the hands of the manufacturers the prompt attention and consideration to which they are entitled. On the other hand the representatives of the various supply associations feel that they have acted conservatively in giving reasonable time for deliberation on the questions brought to their attention, so that the entire membership might become thoroughly conversant with the issues and then express their opinions for the guidance of their representatives. The last month of the old year is a busy one for every manufacturer and supply house with a large number of accounts on their books which it is desirable to have in proper condition at the close of the year, and what with collections and stock taking, the head of a firm finds little idle time during the first month of the year. These considerations may have increased the delay in taking up the questions which the plumbers are impatient to have answered. It is this delay that has probably had something to do with the action of the plumbers in preparing the official list of their members about to be issued. This directory is apparently designed to provide supply houses with a list of plumbers to whom goods may be sold without incurring the displeasure of the plumbers' association. Whether this will lead to any general action by the plumbers in case goods shall be sold to plumbers not on the list remains to be seen. It is to be hoped that friction may be avoided through the influence that the conservative element in both bodies may exert to prevent any radical action.

Already, in some sections, but only in some sections, the manufacturers have been informed that the local master plumbers' associations has a grievance against them. This notice has been accompanied by the statement that if the grievance was not adjusted within a specified time the members of the association would be ordered to stop buying goods from such houses. The information in this correspondence has been placed in possession of all the manufacturers and supply houses. The result has been to revive the old suggestion of making an open market for plumbing goods. But an open rupture can be productive of no good to either of the interests concerned. There can be no doubt in the mind of any one well informed in regard to the protection given to the plumbing trade that it is the best protected trade in the United States to-day. Many of the more conservative plumbers are not only aware of this fact, but appreciate the protection received and find little sympathy with the hairsplitting or the demand for absolute and perfect protection which seems to have led up to the strained relations between the supply houses and the plumbers. Many of the supply houses feel that they have done everything in reason, and they are not only annoyed but irritated to the point of exasperation by the manner in which they are brought to book for petty violations and

infringements through errors in judgment and other oversights which it is found impossible to avoid.

It is asserted by some manufacturers that if the demands made by the master plumbers were carried out it would result in an action before the courts, where their greater responsibility would bring upon them heavier penalties than have been dealt out in the numerous cases throughout the country in which the methods of the master plumbers have brought them before the various courts in which they have been cited to appear. It is an old proverb that "half a loaf is better than no bread," and it would be far better for the master plumbers to accept the excellent protection which they now receive than to take action that would force such retaliatory measures as the making of an open market throughout the country on plumbing goods. An open market would mean that plumbing goods could be purchased from every corner hardware store just as other lines of metal goods can now be purchased. It is fortunate, however, for all concerned that some of the most active and influential members of the supply trade are arrayed against any such an open market scheme. On the other hand there are not wanting those who favor applying this sort of discipline to those customers who seem to court it.

The annual meetings of many State and local plumbing associations are now at hand, and no better opportunity than such meetings provide can be offered for a thorough discussion of the situation in the trade. It would be well to bear in mind that there are two sides to every question, and that to take one side or the other without a thorough consideration of all the points at issue is apt to lead to unsatisfactory and unprofitable strife. The differences which exist should be settled on the give and take principle. The final adjustment must be reasonable and mutually satisfactory or it cannot be permanent.

Selling Heating Apparatus.

A subject that is receiving no little attention, both from the manufacturers of heating apparatus and the contracting steam fitters, is the desire on the part of some of the large building construction companies to purchase material for the power and heating systems installed in the large buildings which they erect. The large contracting steam fitters naturally hold that such companies should not be allowed to purchase materials direct from the manufacturers. They are firmly of the opinion that the sale of heating goods, in whatever quantity, to a construction company would be a violation of the trade resolutions under which manufacturers and steam fitters are now harmoniously transacting their business. There has been no difficulty in disposing of this question under the old conditions, where the construction company contracted with a steam fitter to install the steam plant in a building. A new factor, however, has come into this branch of trade through the employment of a corps of steam fitters by some of these construction companies, who now desire to purchase at first hand all the goods needed in a power and heating plant. The manufacturers of such goods are thus placed in a perplexing position. They are confronted, on the one hand, with a new customer having a large order to place, which they desire to secure, while on the other hand the steam fitters throughout the country assert that this new customer is primarily a builder and not entitled to purchase goods in their line. This question is not an old one, and at present it is confined almost wholly to the large cities; but it is likely to affect the interests of the steam fitters wherever such construction companies take contracts for the erection of large buildings. The steam fitters claim that the manufacturers will lose nothing by living strictly up to the principles of trade protection, as the goods will eventually come from their hands. On the other hand the large construction companies are reluctant to purchase from middle hands such large quantities of material as they require. Meanwhile the question has been the subject of discussion at a number of trade conferences, and there is said to be a prospect of adjustment that will be satisfactory to all concerned.

The Barometer of the Iron Trade.

Under prevailing circumstances the condition of the iron trade is best reflected by the developments in that branch of it which concerns itself with foundry pig iron. The reason is obvious. On the one side we have a very large number of producers absolutely independent of one another, and on the other there are over 4000 consumers, large and small, whose work touches a vast variety of general consumptive requirements. In the steel trade and in nearly all branches of the rolling mill industry there has been such a concentration of interests that it is not usually an easy matter to gauge actual conditions. Events have their free play in the foundry iron trade.

A good deal of anxiety has been displayed lest the iron industry be overtaken by another "boom period," and manufacturers generally show a disposition to apply the brake in order to head off such a contingency, which is regarded as dangerous. A study of the situation in foundry pig iron does not indicate that it is imminent. Both consumption and production are on a very large scale and the position is exceptionally strong. A moderate upward movement has taken place and purchases have been made far into the current year, but there seems little danger of a buyers' scare, which, after all, is the cause of booms. Additional capacity is being prepared for work, which will aid in augmenting the supply.

New Publication.

LIGHT, HEAT AND POWER IN BUILDINGS. By Alton D. Adams, member American Institute of Electrical Engineers. One 12mo vol.; cloth; 102 pages. Price, $1. New York: W. T. Comstock.

This book is intended as a convenient manual on the subjects treated, its object being to present in compact form the main facts on which selections of the sources for light, heat and power in buildings should be based. In the discussion of the subject questions of economy and efficiency are very fully discussed, and the requirements of equipment to suit different conditions. While scientific theories are referred to, the purpose is rather to make practical suggestions that will be applicable in actual practice than enter upon theoretical discussions as to the merits of various classes of apparatus. The feature of special interest in the work and its main novelty, that of arrangement by cost of service from widely different sources, are set down side by side. This feature of this work is one that will be appreciated by all who wish to study up the essential features of plants of this character. It will be found a useful and ready reference for such purposes.

The contract for the power plant of the Louisiana Purchase Exposition, at St. Louis, has been awarded to the Westinghouse Electric & Mfg. Company of Pittsburgh. This plant is to be of 10,723 horse-power. It will be the largest single plant ever put into an exposition and will be located in Machinery Hall, where it is to form one of the exhibits. The directors of the exposition propose to use between 25,000 and 30,000 horsepower for lighting and power purposes in the exposition. The power above that supplied by the Westinghouse plant will be supplied by St. Louis electrical companies.

OAK STOVES.

At recent meetings of the various associations of stove manufacturers the oak stove has occupied a considerable portion of the time devoted to discussion. Only a short time ago the idea that the oak stove was supplanting the handsome square parlor heater would not have been considered as reasonable by the trade. There is a firm conviction to-day, however, that if it has not supplanted the square parlor heater the oak stove has at least filled the larger portion of orders which the manufacturers have received for heating stoves. This has led to an investigation of some of the interesting conditions surrounding this type of heater. To look the situation fairly in the face, the oak stove is recognized by the general public as giving more heat in proportion to cost than some of the old favorites.

Originally the oak stove made no pretense to beauty or finish, and it not only survived its introduction, but grew into popular demand through sheer force of merit. In comparison with the modern parlor heater it suffered much in appearance from lack of finish and ornamentation. Here, it may be said, the trouble began. The oak stove has not changed in price to correspond with its change in appearance. In many instances the original price holds practically the same. When the first nickel trimmings were added they were of comparatively small cost and the additional expense was hardly felt. But as the nickeled base and feet followed the nickeled foot rails and nickeled pilasters accompanied the nickeled rings, necessitating the handsome top ornament, with all of the other trimmings embellished in correspondence, the necessity for a change in price became urgent. The manufacturer now not only has to face a loss on the patterns of his old time favorites through their reduced sale, but also a margin of profit on the oak stoves which have supplanted them so narrow that a valuable source of revenue is no longer available.

This history, even if it may need correcting, is only another instance in which the public have profited by the failure of manufacturers to protect their own interests. The recent advances in iron are known to everybody, but the advances in the price of nickel bands, nickel trimmings and top ornaments, and other small items which enter into the construction of a stove, although of greater effect on the total cost, are known only to the manufacturers. While the buyer seldom has consideration for the seller, it would seem that the time was approaching when the buyer of oak stoves should be willing to afford the manufacturer a fairer return for his enterprise and labor in the production of this now quite generally popular stove. Already, in some associations, an advance in price of 10 per cent. has been made, and it may be naturally expected that this advance on oak stoves will become quite general.

ADVANCED STOVE PRICES IN THE WEST.

The Western stove manufacturers have advanced the price of steel ranges 10 per cent., and of cast ranges 5 per cent. As far as known the advance on heaters has not been definitely settled, and the new price on these goods may not be fixed until nearer the time when orders will begin to be placed for next season's trade. It is not expected that much will be done in the sale of heaters the remainder of this winter, as the trade is undoubtedly pretty well supplied. Such sales as now occur are of a scattering character, and usually represent the wants of some belated buyer confronted by an emergency which compels him to purchase a stove.

The advance made in cooking goods is stated to have been received by the dealers without much objection. They recognize the fact that costs have advanced, as they are familiar with the high prices now ruling on the materials from which ranges are made. The demand is not heavy at present, but both in Chicago and in the rural districts tributary to the city a fair amount of business is doing, which is fully up to the usual movement at this time of the year. Some of the stove houses are reporting a better trade than they enjoyed at the corresponding time last year. All branches of business are in such good condition that wage earners are well employed and families are consequently seeking houses for which they must have furniture.

WHAT SHOULD A FURNACEMAN KNOW?

BY J. K.

We have for some time past been very much pleased, and not a little benefited, by the many good things that our "warm air" brothers have been serving up to us through *The Metal Worker*. It is indeed evident to us that warm air still lives and moves, although sometimes in a mysterious way.

In reading over a Philadelphia contributor's article on "What Should a Coruice Maker Know?" we wondered to ourselves "What Should a Furnaceman Know?" Notwithstanding the volumes that have been written on giving every furnace a plentiful supply of cold air we still find many so-called furnacemen who seem to be of the opinion that cold air is altogether too expensive a luxury for common, every day use.

This fall we had occasion to take down a church furnace that was erected in the fall of 1899, and after two years' use we found the poor thing entirely burned up, with holes in the fire pot and radiator that you could put your fist through. In fact, the ash pit was the only part that remained intact. Upon examination to find out the cause of this we discovered that this furnace was intended to supply two warm air pipes of 16 inches diameter each, and two more of 12 inches diameter each, or a total area of 628 square inches in the warm air pipes. To supply this there was a small hole under the furnace, having an area of about 50 square inches, and even this had no connection with the outside. Is it any wonder that this poor heater became thoroughly worn out in the unequal struggle to save its reputation as a producer of fresh warm air?

We can also tell of other cases very similar to the above, and we again say What should a furnaceman know? or, How can this sloppy and ignorant mode of erecting heaters be improved? as we fully realize that every improperly placed apparatus is an injury to all engaged in the trade by making the consumer thoroughly disgusted with the whole heating business.

Then, again, we have the evil of small warm air pipes to contend with, and the running of wall stacks up on unprotected outside walls. We know of one job under course of construction where one pipe 3 x 10 inches is supposed to heat a parlor 16 x 16 feet and a chamber above of the same size, each having an almost solid glass front and two exposed walls. Now why will so-called "furnacemen" continue to do this, when a little common sense should teach them better?

Our idea of placing any warm air heater is: 1, To set our mind on some good heating apparatus; then to be sure to get it large enough to have some surplus strength left, even on the coldest days; 2, have backbone enough to secure for this a good central location, so as to equalize the run of pipes; 3, to make all pipes of ample size with easy turns. Then further, do not on any account use two-piece elbows, or connect round pipe to stacks without the use of some good style of boot or starter. This is very important, as we have seen otherwise well constructed jobs spoiled by running pipes into the sides of narrow stacks. Abolish the old, cramped, shallow, contracted register box and use the improved hopper style. They are just as easily made and take no more stock, have no dead corners to gather dirt and allow the air to flow more freely. Last, but not least, do not forget the cold air supply. Do give the poor hard working heater plenty of fresh air to breathe, poor thing. It will get plenty of abuse and hard usage after you have left it to its work and fate in the cellar, without denying it the very necessity of its life—air.

MICHAEL BARD, who represented the Triumph and Etna lines of Stoves and Ranges for the Pittsburgh Stove & Range Company, has resigned to accept a position with the Prizer-Painter Stove & Heater Company. Mr. Bard will be attached to the company's Pittsburgh office, which has recently been opened under the management of Charles W. Goodnough.

THE ASTOR HOUSE STOVE ASSOCIATION?

Having recognized the demoralizing effect on the general stove trade of making New York City a place for open competition, the influence of the stove manufacturers in other sections has probably been the cause of the reeent visit to New York of Secretary Hogan of the National Association of Stove Manufacturers. Evidently his influeuce has been suceessful in inducing manufacturers in the East to meet for the purpose of endeavoring to remove the unsatisfactory conditions. Under date of January 18 a call signed by President H. T. Richardson of the old association was sent out by the secretary, W. J. Myors, for the principals of interested stove manufacturing concerns to meet at the Astor House, New York City, on Thursday of this week to consider the reorganization of the old assoeiation, or to form a new association on somewhat different lines.

The result of this call was a fair attendance at the meeting of the manufacturers interested in the trade in this section. The condition of the trade in New York and immediate vicinity and the relation of the different manufacturers to it was thoroughly discussed. This resulted in the appointment of a committee for the purpose of devising some plan for reorganization of the association on new lines that will be acceptable not only to the members of the old association, but to those who had withdrawn from it, or had refused to join in the work it was engaged in. The commlttee have a difficult task before them, and those who are invited by its members should accord them a full hearing and give a generous consideration, if not aetive assistance, to the plans that may be presented. The work is in the interests of the whole trade, and is worthy of its co-operation. This movement, lf suceessful, will be followed by an advance in prices in this section, in line with the advances that have been made by the various associations in other parts of the country.

The Unique Fire Place Damper.

Robert Jahn, Scotch Plains, N. J., has been awarded a patent on the fire place damper invented by him, and whlch he is manufaeturing and selling under the name of Unique. Thls damper is of novel form, in that the frame is made in several pieces, so that it can be readily taken apart and put in the chlmney throat by sections with little labor in a short time. When operated with wood fires no smoke will enter the room, but the construction of the damper deflects the heat downward and into the room. The damper can be regulated with ease by means of a regulating rod even when a fire is burning; and it has no hinges or slides to rust or become clogged. It can be plaeed easily ln any fire place already built without cutting or damaging the front, and the work can be done by any ordinarily intelligent mechanic. The damper is claimed by the manufacturer to provide a perfect means of vontilating a room, whlle securing econemy of fuel with the maximum of heat. The dampers are made in nine sizes, with frames of 27 x 12, 30 x 13, 33 x 13, 35 x 13, 40 x 13, 30 x 16, 33 x 16, 35 x 16 and 40 x 16 inches dimensions.

The Alaska Stove Trimmings.

The Troy Nickel Works, Albany, N. Y., are sending to the trade a 56-page catalogue devoted to the Alaska goods manufactured by the concern. The front and back covers are finished with a pleasing color effect, showing a cake of ice in which the words "Alaska Stove Trimmings" and the address of the house are carved. An Alaska cover lifter and an Alaska oven door handle appear to be frozen in the eenter of the ice cake. This is the nineteenth annual catalogue of the house. The goods shown begin with tea pot handles and screen door handles, followed by the Troy damper for hot or smoke pipe and clips for sheet iron dampers. Several pages are devoted to fire sets for kitchen and parlor use, followed by Alaska fire shovels, pokers and cover lifters, shown in various styles. In the next seetion are presented Alaska soldering iron handles, ice picks, saucepan handles, kettle ears and kettle bails. Alaska turnkeys for sheet iron ovens, Alaska stove knobs, turnkeys and oven door handles in great variety occupy the next 20 pages, some of the trimmings being especially adapted to steel ranges. Hinge plus, malleable turnkeys, damper slide knobs, turnbuckle tongs and flue stop keys are followed by a variety of ornamental stove urns. The last pages are occupied by stove bolts.

The Ohio Valley Stove Association.

The third annual meeting of the Ohio Valley Stove Association, held at the Washington Hotel, Portsmouth, Ohio, on January 9, was opened by a banquet tendered by the Portsmouth contingent. The principal outcome of the business meeting was the adoption of the following announcement: "Owing to the continued advance in raw material going into the make up of stoves and ranges, we withdraw all quotations." This notice was ordered to be sent by all members to the dealers. There was no election of officers at this meeting. The next meeting will be held in Columbus, at the call of President J. D. Foster, president of the Foster Stove Company of Ironton, Ohio.

Mr. Foster was unable to be in attendance at the banquet which preceded the meeting, and in his absence Mr. Hertenstein acted as toastmaster in a very happy manner. After the elaborate *menu* was disposed of the following speakers responded to the various toasts: Frank V. Knauss of the Portsmouth Stove & Range Works, Robert Bryan, secretary of the Portsmouth Stove & Range Works, who responded to "The Ladies," and Thomas J. Hogan, secretary of the National Association of Stove Manufacturers, who praised the hospitality of the hosts, and spoke of the flourishing condition of the industry throughout the United States. L. W. Baker, vice-president of the Portsmouth Stove & Range Works, made a pleasing address, and Henry F. Bertram of the Ohio Stove Company recited several of Ezra Kendall's stories.

The following is a list of the guests who were present: L. E. Marting of the Foster Stove Company, Ironton; R. T. Thompson of the Gallipolis Stove Company; George D. Gibbons and Sherman W. Gibbons, Zanesville; Mayor Milstead; J. R. Clare, Henry Bertram, E. S. Clare and Washington Kinney of the Ohio Stove Company; John B. Knauss, F. V. Knauss, L. W. Baker, R. G. Bryan and R. E. Calvert of the Portsmouth Stove & Range Works; J. G. Niell of the Niell Stove Company; Thomas L. Bell of the Bell Stove Works, Gallipolis; R. Johnson, Bellaire, Ohio; T. J. Hogan, secretary of the National Stove Association, of Chicago, and A. Winsor of the Marietta Stove Company.

STEEL RANGES.

The most interosting question with the manufacturer of steel ranges at the present time is the price of these goods. During the past year the cost of producing steel ranges was very much increased by conditions over which the manufacturers had no control; and, in consequence, the impression prevails that the business was done at a very small and unsatisfactory margin of profit. Even those manufacturers who took a correct view of the future and attempted to protect themselves by laying in a stock of steel sheets suffered as well as their competitors who showed less forethought. The scarcity of steel sheets made it impossible to get deliveries of stock as promptly as desired, or in quantities that were satisfactory. During the latter part of the year many concerns were foreed to buy the necessary sheets wherever they could be picked up in the market at a price that is said, in many instances, to have involved a loss on the orders filled. Throughout the country, wherever the manufacturers have met, there has been evidence of a strong disposition to advance prices on these goods, so as to stop at least any loss. From some quarters there are already reports of an advance of 10 per cent. in prices. Through the energy that was expended on the introduction and sale of steel ranges last year many retail stove dealers throughout the country have built up a trade, and are

now having a considerable demand for these goods. In order to proteet themselves, these dealers should mark the steel ranges which they have in stock with the higher prices that they will be forced to ask on the new goods they buy to replace the ranges sold. Such actlon can also be taken with advantage on oak stoves, for it is reported that oak stoves have also been advanced 10 per cent. in many localities, owing to the lncreased cost, not only of the steel, but of other materials entering into their construction.

ODD PLATES.

The Wrought Iron Range Company of St. Louls, Mo., at their annual meeting this week elected officers and directors as follows: H. H. Culver, president; W. L. Culver, first vice-president; W. T. Moore, second vice-president; B. B. Culver, secretary; E. R. Culver, treasurer, and R. F. Bradshaw and Martin Collins, with the above, directors.

The Kelsey Heating Company of Syracuse, N. Y., are sending out a calendar bearing sectional views showing the construction of the Kelsey Warm Air Generator. An attractive feature of the calendar is a handsome portrait in colors of a charmlng brunette, entitled "Carnation."

W. P. Millar, who has filled the position of manager of the Stove and Furnace department of the James Smart Mfg. Company of Broekville, Ontario, Canada, for the past six years, will sever his connection with the company on February 15 and proceed to Shanghai, China, where he has been offered the position of superintendent of agencies for the China Mutual Life Insurance Company. Mr. Millar was instrumental in introducing the Kelsey Warm Air Generators to the Canadian trade in 1896, since which time these Generators have been successfully placed in all parts of the Dominion from the Atlantic to the Pacific.

The plant of the H. Wetter Mfg. Company of Memphis, Tenn., was visited by a fire on the nlght of Sunday, January 19, which practically destroyed the works. The loss is reported as heavy, but fully covered by insurance.

The Union Stove Repair Company, 2852 and 2854 Archer avenue, Chicago, are endeavoring to secure a building better adapted to their increasing business. The company enlarged their quarters during the past year, but the continued growth of their trade necessitates further expansion. They attribute this gratifying condition of affairs to their making a specialty of furnishing "orlglnal" Stove Repairs. A. A. Lamoreaux is president of the concern and O. J. Allison is secretary and treasurer.

At the recent meeting of the Lebanon Stove Works at Lebanon, Pa., the following directors were elected for the ensuing year: H. H. Kreider, F. E. Meily, H. A. Reinoehl, S. P. Reinoehl, A. W. Shultz, A. S. Light, A. A. Reinoehl and John H. Seltzer.

It is expected that the Kalamazoo Stove Company of Kalamazoo, Mich., will have their works in full runnlng order the latter part of February. We understand that it is the intention of the company to sell their product directly to the consumer instead of through the medlum of dealers, and they will therefore dispense with traveling salesmen, it being their intention to advertise extensively in newspaper and other mediums in order to bring their business promlnently before the public.

At a meeting of the Board of Managers of the Penitentiary of the State of Ohio a five-year contract was closed with the Pioneer Stove Company of Columbus, Ohio. The contract calls for the services of 90 men and a substantial lncrease ln wages to be paid to the State.

The Cortland-Howe Ventilating Stove Company of Cortland, N. Y., have begun to dismantle their works. The plant is to be moved to Royersford, Pa., where the concern will in future carry on the business of Stove manufacture. The company, of whom William H. Clark is manager, were organized in 1887, and until the latter part of 1888 their Stoves were manufactured in Fulton. At that date the work was taken to Cortland. At one time about 70 hands were employed, but for the last few years the force has been gradually reduced.

It was announced a year ago that the Scranton Stove Works of Scranton, Pa., would share the profits of the business with their employees, and in accordance with this plan the company on January 17 dlvided something like $4000 among the 165 men which they employ.

Terstegge & Gohmann of New Albany, Ind., enjoyed a very gratifying volume of business during the year just brought to a close. The large plant of the concern was in steady operation, giving employment to a considerable force of hands. The outlook for the new year is most encouraging, and we understand that the volume of business for the first half of the present month exceeded by a large margin that of the correspondlng period of last year.

The Stove trade will regret to learn of the sudden death on January 16 of Otto Germer, Sr., of the well-known firm of Black & Germer of Erie, Pa. Mr. Germer was in his accustomed health in the morning and attended to his business until noon, when he went home for his midday meal. A few moments after his arrival he was stricken and died before a doctor could be summoned.

At Pittsburgh, in the patent lnfringement case of H. Adler against the Adams & Donaldson Mfg. Company and Demmler Bros., a preliminary injunction was refused. A gas stove is involved. The court sald that the questions involved should not be determined at this preliminary stage, and that it is the usual practice for motions for preliminary injunctions in cases in which the patent had not been sustained to go to a final hearing. The suit now goes on the regular trial list.

Owing to the famine ln coke the McClary Mfg. Company, London, Ontario, Canada, have not yet started up the Stove works in Hamilton that they purchased from the Copp Bros.' Estate. The foundry may be started in a short time, however, if the necessary fuel can be got.

The Cook & Van Evera Company, 38 Lake street, Chicago, have been appointed Northwestern sales agents for the Twentieth Century Furnace. A soft coal Furnace was needed for their trade, and this Furnace was selected as meeting the requirements desired.

The American Tube & Stamping Company.

The Wilmot & Hobbs Mfg. Company gave notice that they have sold out as of January 1 their entire business and property, subject to the liabillties, to the American Tube & Stamping Company of Bridgeport, Conn. This year the new company will be making Swedoh steel billets in their new open hearth furnaces and blooming mill, and possibly large steel castlngs, thus assuring an adequate supply of raw material. In the press and stamping business they contemplate continuing the policy of refraining from competing with the customers of thelr rolling mill department. The officers of the eompany are: Frank A. Wilmot, president and treasurer; Albert N. Stanton, vice-president; Clarence D. S. Miller, second vice-president; Henry W. Nutt, secretary, and Albert J. Middlebrook, assistant treasurer.

The dam now being constructed for New York's water supply will, when finished, be the largest in the world. It will form a reservoir 19 2-3 miles long, fed by a water shed of 373 square miles. The water will submerge the old Croton dam 34 feet, put farms and houses, now tenanted 50 feet or more under the flood and increase the present avallable storage capacity of Croton Lake from 2,000,000,000 to 32,000,000,000 gallons. New York will then have in all the reservoirs of the Croton water shed about 74,500,000,000 gallons of water in storage as protection against drought. After the new dam is completed it will take five years to fill the reservoir.

A. W. Payne has succeeded Payne Bros. in the Hardware, Stove and Sporting Goods business in North Salem, Mo.

THE TEMPORARY WARMING OF THE LARGE HALL OF THE PALACE LIBRARY, VIENNA, AUSTRIA.*

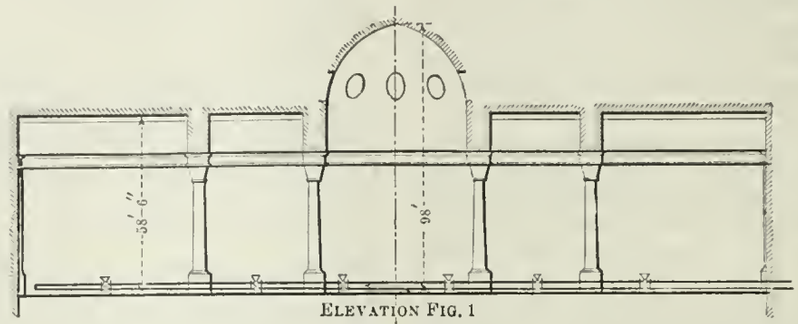
BY PROF. EDWARD METER OF THE IMPERIAL TECHNICAL HIGH SCHOOL, VIENNA.

Translated from the German by Charles F. Hauss.

The subject that I am about to submit to you to-day may not be of very great importance and may not occur under the same conditions again, yet it seems to me to be so unusual, owing to the peculiar conditions and method of handling, as to be worthy of your attention.

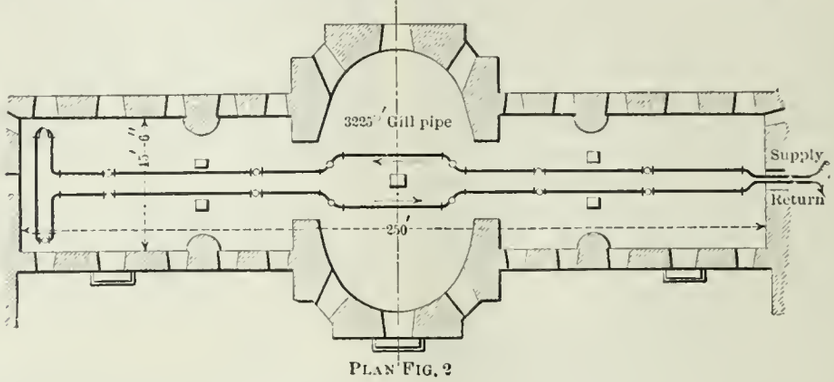
The hall is the large book room of the Imperial Court Library, designed by Court Architect Fischer von Erlbach and finished about 1736. The walls are all covered with costly shelving made of rare woods, and filled with priceless books and manuscripts, the ceiling is beautifully frescoed and the floor is made of mighty slabs of stone.

This hall had never been artificially warmed in its nearly 200 years of existence, and when you know that the order to heat it came only a few days before the intended reception, and during the cold season of the year, for such a select gathering, you will have some idea of the task set for us.



Figs. 1 and 2 show a sectional elevation and plan of the hall. It was a sudden idea of the Court Marshal, placed in the front rank of the programme, that the Austrian Emperor should lead his young and ambitious guest, Germany's Crown Prince, through the grand library hall to show him some of his priceless treasures. Naturally a great deal of thought was given to properly carry out this idea.

The greatest difficulty was to install the heating apparatus, the order for which was given about the end of March. The weather was cool and variable, and the reception was to take place on April 14.



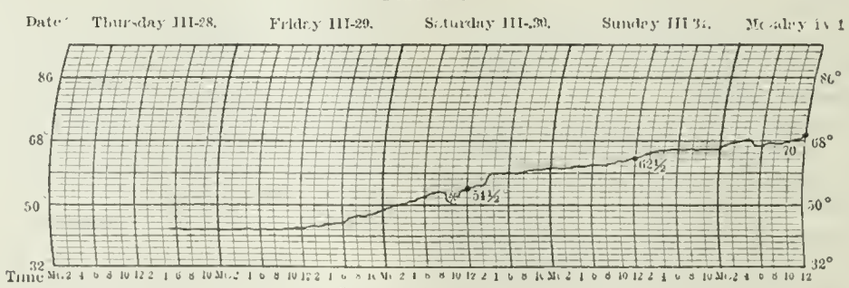
Now we knew that in former years the hall seldom had a temperature of 50 degrees F. even in May, when the attendants entered it wearing overcoats.

A personal survey showed at once the many difficulties in the way; the book covered walls forbade the setting up of radiators, and the fact that all the rooms under the hall were filled with books prevented the introduction of heat through the floor. Added to this was the anxiety of the Library Direction that a sudden change in temperature and moisture of the air in the hall might have a bad effect on the wood work, books and bindings, which was anything but encouraging and urged on us the greatest care. There was no thought of erecting a permanent heating apparatus, owing especially to the lack of time.

One help in the solution of the problem lay in the fact that the end of a steam main that is part of the system for heating the new palace was not far away, and allowed us, with slight changes, to get steam at 39 pounds pressure. The method of using this steam was not long in doubt, for the first thing to impress the expert was the large stone floor space, with which the body must come in close contact.

ELEVATION FIG. 1

PLAN FIG. 2



Fifteen minutes on this floor was enough to give one very cold feet, which great loss of bodily heat necessitated the giving of special attention to warming the floor.

This prompted the decision to distribute the heating surfaces as near the floor as possible and through the middle of the hall, and by a continuous heating of the space have the surrounding walls and floor absorb enough heat and store it, that they would give off again after the apparatus was removed, and leave the space warm enough on the day of the reception to make it safe for the imperial guest to spend some time in the hall.

For removing the heating apparatus, airing and decorating the hall three days were allowed, and it was determined that the temperature should at no time exceed 82.4 degrees F and that the usual relative amount of moisture in the air should be maintained.

The construction of the apparatus was intrusted to the firm of J. L. Bacon, in Vienna, and little time was lost before the work was commenced. The amount of heat necessary to maintain a temperature of 59 degrees F. in the hall when the outside temperature was 41 degrees F. was about 600,000 heat units per hour. The amount of radiation used in the work was 3225 square feet of gill pipe, or extended surface radiation, rated to

FIGURE 3

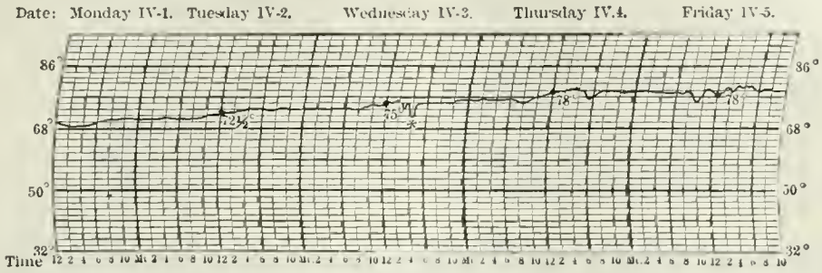
* Break in heating

* Paper read at the eighth annual meeting of the American Society of Heating and Ventilating Engineers, New York City, January 21-23, 1902.

give off about 800,000 B. T. U. per hour. The pipe was laid in two lines, as near the floor as possible, to allow for drainage in the two lines, which are together about 500 feet long. These gill pipes are shown in Fig. 8. The work was finished in the short space of three days and on March 28 at 5 p.m. steam was turned on.

The heat was maintained continuously day and night until April 7, after which, the temperature having reached the limit of 68 degrees F., the heat was only maintained for 12 hours each day.

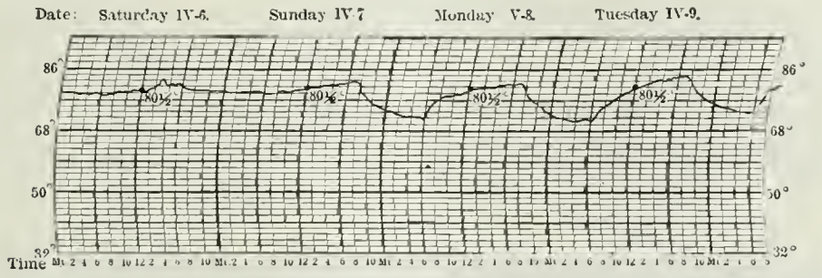
At 6 o'clock a.m. on April 12 the heating apparatus was removed, and at 3 o'clock p.m. on April 14, or three hours before the reception, the doors and windows were opened to thoroughly air the hall.



The record of temperature was kept by two registering thermometers, one on the floor, the other in the gallery. Figs. 3 to 7 show the record of the gallery thermometer.

It may be well to mark the rapid rise in temperature from the beginning of the time of heating—up to 69.8 degrees F.—and the much slower drop in temperature after the heat was shut off. Yet the increase as well as the decrease was gradual, and shows that the walls and floor did store the heat.

The diagram shows that on the day of the reception the inside temperature was about 68 degrees F. The average outside temperature was 47.3 degrees F. It is remarkable that the floor thermometer registered during the first period of heating from 2.2 to 3.6 degrees F. higher than the gallery thermometer.



Aside from the observation of the space tempera-

* Airing of the hall.

FIGURE 7

* 69° at time of the reception

FIG. 8.—CAST IRON GILL PIPE RADIATION USED.

The sections are 6 feet 6 inches long, with flanges, and have 42 square feet of surface per section.

tures we also made tests of the floor temperatures with quicksilver thermometers, that were set in bored holes 2¾ inches deep. This record is shown in Fig. 9, which also shows the relative position of the heating pipes and the position of the floor thermometers.

When heating was commenced, with an inside temperature of 42.8 degrees F., a relative moisture of 70

per cent. was contained in the air, which percentage was maintained throughout by 14 tin funnels filled with pebbles and attached with regulating valves to the steam pipes, and through which steam was allowed to escape. Fig. 10 shows this air moistener.

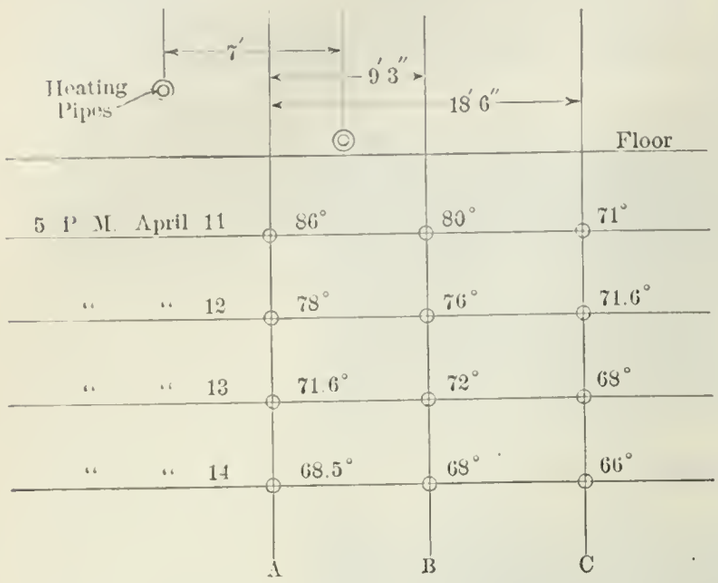

FIG. 9.—SHOWING RECORD OF FLOOR TEMPERATURES.

The heating pipes were placed 7 feet apart. The vertical line A is the thermometer between the pipes, line B the one 9′ 3″ from center, and line C the one placed 18′ 6″ from center of radiation.

The success of this arrangement was complete, the hall was heated to the proper temperature at the time of the reception and there was no injury to either wood work or books.

Fig. 11 shows an interior view of the hall when the heating apparatus was in, and gives a good idea of the general conditions.

The Joseph Dixon Crucible Company, Jersey City, N. J., give interesting information concerning the protective painting of the Union Railroad Bridge, which crosses the Monongahela River at Rankin, Pa. The total weight of this bridge is 5135 tons, and it has a total length of 2328 feet. Designed for carrying molten metal from the Carrie Furnace to the steel mill and raw materials to the furnaces, this notable steel structure is subjected to heat from the molten metal, sulphur fumes from locomotives and river steamers, also from the adjoining furnaces and steel mills. No other steel bridge in all the world is exposed to so many and severe destructive agencies. The best metal preservative was necessary, and the eminent engineers in charge of the work selected for its protection Dixon's silica-graphite paint, manufactured by the Joseph Dixon Crucible Company.

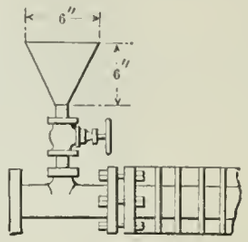

FIG. 10.—AIR MOISTENER.

A 6 x 6 inch tin funnel filled with pebbles, through which the steam from a ½-inch valve is allowed to reach the air.

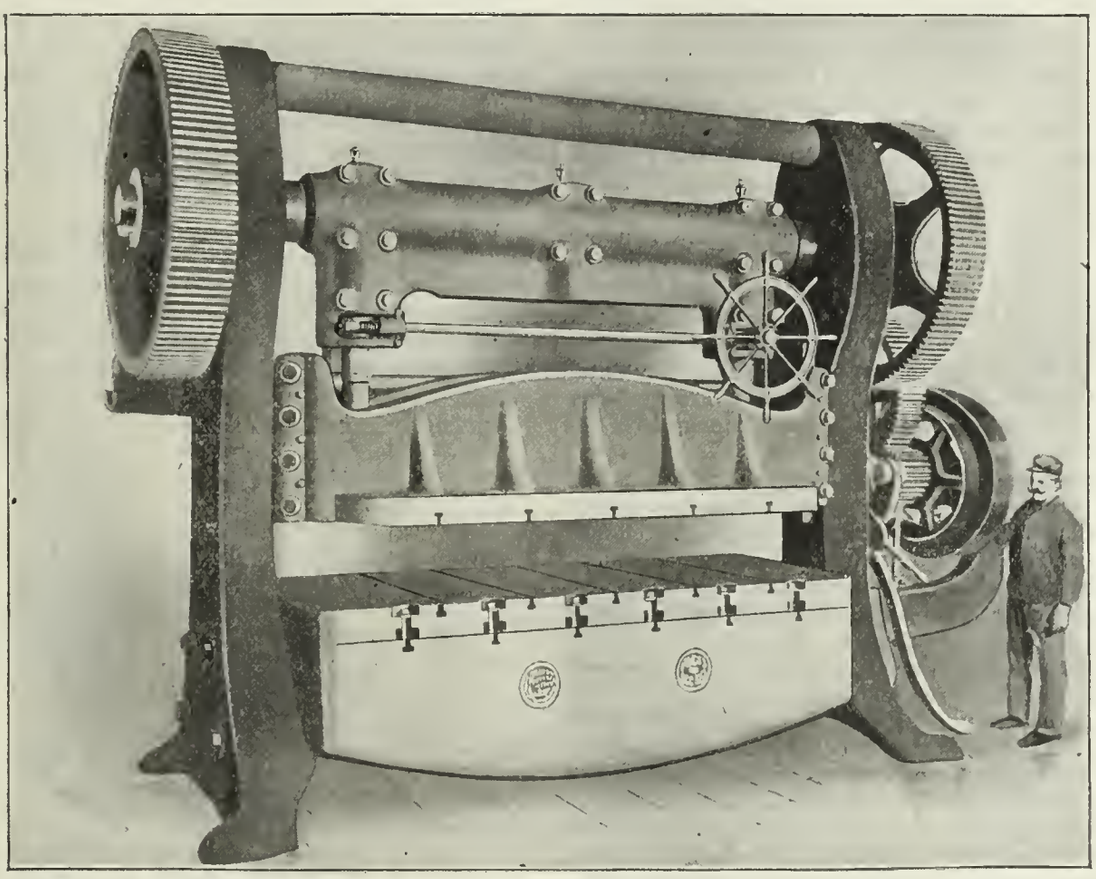

FIG. 11.—INTERIOR VIEW OF THE IMPERIAL COURT LIBRARY IN VIENNA.

A Large Ferracute Stamping Press.

The Ferracute Machine Company of Bridgeton, N. J., recently built an unusually large press from designs by Oberlin Smith. It is of the double crank type and embodies several features which are unique in machines of this class. There is an improved construction for the prevention of upward deflection in the long shaft between its journal bearings in the main housings. This is accomplished by extending the pitman casting continuously from end to end, instead of by putting additional bearings in a trussed beam connecting the top of the columns, as is usual. This arrangement simplifies the design in some respects, as it is always desirable to connect the pitmen, and the same casting, by making it front. A power attachment for this adjusting device can be provided, if desired.

The machine in question was especially intended for the embossing of steel doors, door frames, ceiling plates, wall plates and other ornamental architectural work. Its total weight is about 76,500 pounds, and it has been tested to over 400 tons ram pressure. The maximum working pressure, however, is assumed to be 300 tons, and it will take in a sheet of metal 10 x 4 feet, with allowance for clearance. Some of its various measurements are as follows: Hole through bed, 44 x 108 inches; distance in the clear between columns, 124 inches; hight from bed to ram, when up, 26 inches; standard stroke of ram, 4 inches; adjustment of ram downward, 10 inches; fly wheel, 40 x 7 inches, with a weight of 800 pounds, and a speed of 400 revolutions per minute; ratio of gearing, about 25, variable to 50, if desired; extreme hight from floor, 140 inches; extreme length from right to left, 208 inches; extreme depth front to back, 69 inches; bolster thickness, 6 inches.

A Large Ferracute Stamping Press.

somewhat deeper and stronger, will give as good an effect as is attained by the other method.

The machine is equipped with a new automatic friction clutch which, by a pressure on the treadle, causes it to make one stroke and stop with the ram up.

By a slight change of adjustment the machine may be worked by hand, the pressure of a single finger on the handle (shown at the right in front) sufficing to stop or start, and to bring the ram to any desired position. This can be done so delicately that the periphery of the main gears can be moved ⅛ inch at a time. A third condition of adjustment in the clutch allows for the continuous running of the ram. An adjustable brake is automatically thrown in when the driving friction is thrown out, and *vice versa*.

A feature, not common in presses of this kind, is the use of twin gears upon the main shaft, and twin pinions to drive them. This system is desirable for long shafts, where the hardest work may come near either end, as the torsional spring of the shaft is obviously much decreased. Moreover, each pinion, gear and main shaft journaled has only half as much work to do as is the case with the usual construction, with one large gear doing all the work from one end.

The gearing is all cut from the solid, the large gears upon the main shaft weighing over 1 ton each. The pinions are of steel. The adjustment of the ram, after slacking the pinch bolts upon the pitman stem screws, is performed by revolving the pilot wheel shown in

A Model Employer.

A marked characteristic of the late Christopher Zug of Pittsburgh, who passed away last week at the venerable age of 95 years, was the constant consideration he showed for his employees. It is said of him that there was no prominent manufacturer in America who had less contention with his workingmen than this Pittsburgh ironmaster. He not only regarded the rights of his employees, but he also entered to a large degree into their sympathies and aspirations, striving in every way for their material as well as their social and intellectual advancement. Mr. Zug was regarded as a strong friend of union labor, and the signature of Zug & Co. was always the first, or one of the first, to be attached to the Amalgamated Association wage scale. Such a thing as a serious dispute at the Zug mills was entirely unknown. Mr. Zug's death has called forth many expressions of regard and regret from the workingmen of the Pittsburgh district. It was eminently fitting, in view of the relations he held with them, that a number of puddlers from his rolling mills and other workingmen were selected to act as pall bearers at his funeral.

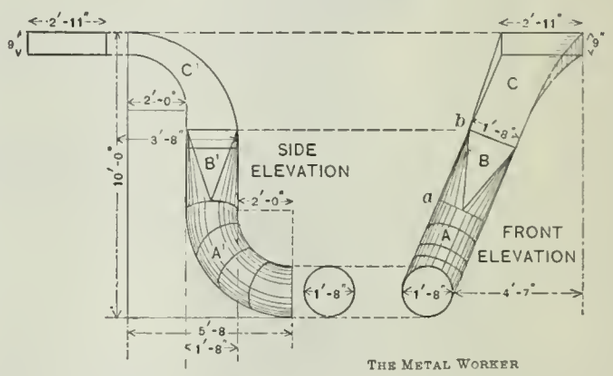
The Fred. J. Swaine Company's Sheet Metal Machinery.

A new illustrated catalogue of 84 pages in a neat cover has been issued by the Fred. J. Swaine Company, 930 and 932 North Main street, St. Louis, Mo., covering their line of power presses, swedging machines, foot presses, double seamers, drop presses, dies and special machinery for working wire and sheet metal. In the introduction the company state that since issuing their last catalogue they have made many improvements in the various lines they manufacture. The first part of the catalogue is devoted to open front power presses used in working tin and other light sheet metal in various shapes. In these presses the company claim to have embodied the best points of all other presses, especial care being taken to make them on as near a straight line principle as possible, securing the greatest rigidity of material to withstand the heaviest strains. All their presses are built to standard, and all standard tools can be used or exchanged from one press to another. The company's improved box cap grip is a feature of all their presses. Automatic feeds set to different requirements are also applied to the various presses. These presses are shown in a number of different styles suitable for all kinds of work in sheet metal, including punching, horning, embossing, wiring, stamping, crimping, swedging, doubling, seaming, bumping and finishing tools, designed to form light sheet metal articles in the quickest possible time. Each machine is fully described, together with information regarding its adaptability to different machines. The presses are made in sizes varying in capacity from a small can up to a 24-inch galvanized iron washtub.

Other machines included in the catalogue are power lifters for drop presses, Peck's patent drop lift, power forming rolls, crimping, beading and flanging machines, crimping, beading and trimming machines, foot forming and stamping machines, sheet metal oiling machines, gang and slitting machines and trimmers, and a variety of foot and arch screw presses. Foot power squaring shears, tin folding machines, grooving machines and wire forming machines occupy the last pages of the catalogue. The company state, in connection with the present catalogue, that the fact of the absorption of nearly all the leading can factories and the majority of the manufacturers of can making machinery into one large concern, together with the increasing demand for tin packages of all kinds, has made can making machinery in great demand. In the present catalogue they show that they have taken steps to meet this demand in the fullest possible manner.

New Tin Plate Mill at McKeesport.

The McKeesport Mfg. Company, recently organized, intend to build a ten-mill tin plate plant at Port Vue, near McKeesport, Pa. Plans for the plant are being drawn by S. Diescher & Son, consulting engineers, Hamilton Building, Pittsburgh. The buildings will be of iron and steel construction and the mill building will be 210 x 350 feet; tinning and assorting building, 50 x 600 feet; boiler house, 40 x 150 feet; electric plant, 40 x 60 feet, and warehouse, 40 x 100 feet. The new plant will have direct connection with the Pittsburgh & Lake Erie Railroad. Contracts for most of the machinery have already been placed and the concern hope to be making tin and terne plate by September or October. E. R. Crawford will be general manager and J. E. Lauck will be superintendent. Both of these parties have been connected with the Demmler Works of the American Tin Plate Company for some years.



The Juniata Tin Plate Company, capitalized at $250,000, will build a Black Plate mill and Tin Plate factory at Greencastle, Ind. F. M. Strong, for several years manager of the Elwood plant of the American Tin Plate Company, has resigned that position to take charge of the new company. Associated with him are Samuel Lewis, William H. Richards, J. H. Seiberling and H. M. Strong.

Pattern for Twisted Transition Elbow.

A correspondent in Memphis, Tenn., submits the following inquiry: "I send herewith a drawing for some piping in a grain elevator and would be pleased to receive information regarding same through *The Metal Worker*. The connections must be made in the elbows and the flare on the side of the top elbow must be made all on one side, so as to pass the rafters in the building."

In Fig. 1 is shown a reproduction of our correspondent's sketch, showing the front and side elevations of the elbows and connections with the full size measurements thereon. By referring to the front elevation, which shows three different fittings, which we would advise our correspondent to use, A shows a pieced elbow, shown in side view by A^1. B is a transition piece joining the round elbow at *a*, shown in side view by B^1, while C is a twisted transition elbow, 20 inches square at *b*, flaring to one side, as shown, to connect with a pipe 9 x 35 inches, and is shown in side view by C^1. The pieced elbow at A is cut in the usual manner, while the transition B is developed as shown in "The New Metal Worker Pattern Book" on page 336.

What our correspondent evidently desires is the pattern for the twisted transition elbow C, and to avoid a confusion of lines, which would occur in so small a space, enlarged diagrams are shown in Fig. 2, in which 1 2 12 11 is the side of the elbow shown in front by 1, 2, 2°, 1°, 12° and 10. which represent similar shapes, as shown

Pattern for Twisted Transition Elbow.—Fig. 1.—Reproduction of Correspondent's Sketch.

by C^1 and C respectively in Fig. 1. The first step in Fig. 2 is to divide the two curves in side view into an equal number of spaces, as shown by the small figures 2 to 12 on the outer curve and 1 to 11 on the inner curve. At right angles to 1 2 in side elevation and from points 2 to 12 on the top curve draw horizontal lines intersecting the top of the elbow in front elevation at 2, 4, 6, 8 and 10 on the line 2 10, and at 2°, 4°, 6°, 8°, 10° and 12° on the line 2° 12°, as shown. In similar manner, at right angles to 1 2 in side elevation and from points 1 to 11 on the bottom of the elbow draw horizontal lines intersecting the bottom of the elbow in front elevation at 1, 3, 5, 7 and 9 on the line 1 9, and at 1° 3° 5° 7° 9° and 11° on the line 1° 11°, as shown. In this connection it should be understood that the corner or miter lines 2 10, 1 9 and 2° 12°, 1° 11° are drawn at pleasure after the dimensions are obtained; but when once drawn remain fixed lines.

For the pattern for the top of the elbow proceed as follows: At right angles to 2 2° in front draw the line 12′ 2′, upon which place the stretchout of the top curve 2 to 12 in side elevation, as shown by 2′ to 12′ on the line 12′ 2′. At right angles to 2′ 12′ and from the small figures draw lines, as shown, which intersect with lines, not here shown, drawn from points having similar numbers on the miter lines 2 10 and 2° 12° at right angles to 2 2° in front elevation, thus obtaining similarly numbered intersections in A. A line traced through the points thus obtained, as shown by 2 2° 12° 10, will be the pattern for the top of the elbow.

For the pattern for the bottom draw a line, 1′ 11′, at right angles to 10 9°, upon which place the stretchout of the bottom curve 1 11 in side elevation, as shown by

similar numbers on 1′ 11′. At right angles to 1′ 11′ and from the small figures draw lines, as shown, which intersect with lines, not here shown, drawn from points having similar numbers on the miter lines 1 9 and 1° 11° in front elevation at right angles to 9 9°, thus obtaining similar numbered intersections in B. A line traced through points thus obtained, as shown by 1 1° 11° 9, will be the pattern for the bottom of the elbow.

The patterns for the sides E and F will be developed by triangulation. As the method used for obtaining the pattern E can also be applied to F, only the side E will be developed. Now, from the various points in the side view connect lines 2 to 3 to 4 to 5 to 6, 7, 8, 9, 10 and 11, as shown by distances having similar numbers. At right angles to C D draw lines from the various points, as shown. Then take the various horizontal distances and place them on similar lines just drawn. For example, take the horizontal distance 2 3 and place it, as shown, from 3° to 3 in the diagram of triangles, and draw a line from 3 to 2°. In similar manner take the horizontal distance from 3 to 4 and place it, as shown, from 4° to 4 in the diagram of triangles and draw a line from 4 to 3°. In this manner obtain all of the triangles for the twisted side E. Then, using these triangles and the patterns for the top and bottom, whose miter lines show the developed lines for the corners of the elbow, we are

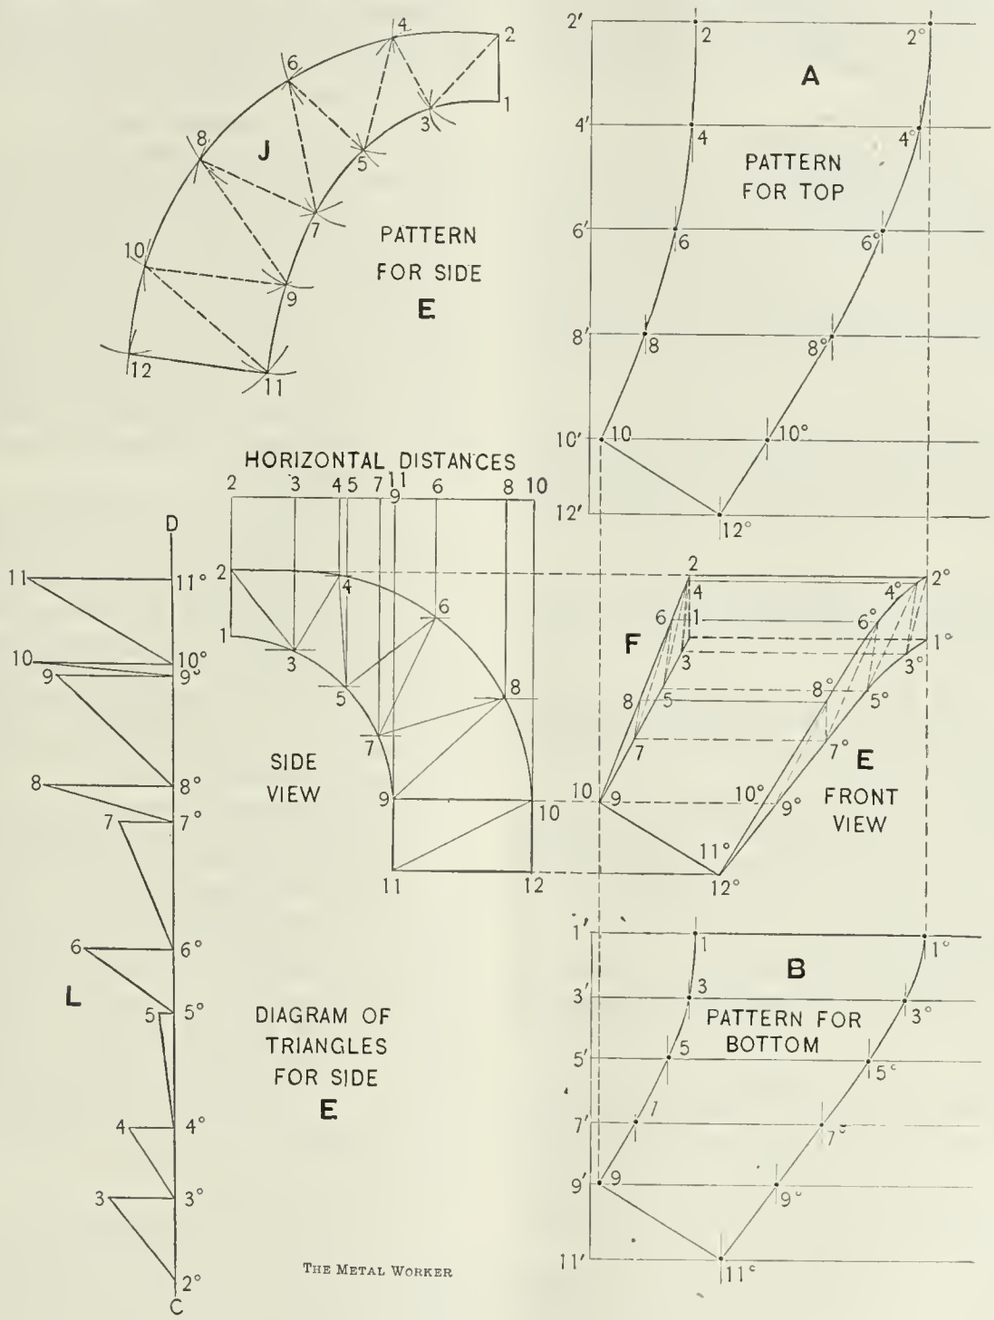


Fig. 2.—Side and Front Views, Diagram of Triangles and Patterns.

as shown. In similar manner, in the side E in front connect points 2° to 3° to 4° to 5° to 6°, 7°, 8°, 9°, 10° and 11°, as shown, and proceed in the same manner for the side F by connecting 2 to 3 to 4 to 5 to 6, 7, 8 and 9, all as shown. Then will the lines shown in E and F represent the bases of the triangle which will be constructed, and the horizontal distances between the points in the side view the altitudes or hights. To obtain these horizontal distances in the side view draw any horizontal line, 2 10, on which erect perpedicular lines drawn from the various points in the side view, as shown, thus obtaining similarly numbered figures on 2 10 corresponding to those in the side view. For the diagram of triangles for E erect any line, as C D. Now take the various distances in the dividers in the side E, as from 2° to 3°, 3° to 4°, 4° to 5°, 5° to 6°, 6° to 7°, 7° to 8°, 8° to 9°, 9° to 10° and 10° to 11°, and place them on the line C D, ready to strike out the pattern for the twisted side E in front. Thus, in J draw any line, as 1 2, equal to 1° 2° in E. Now with 1° 3° in B as radius and 1 in E as center describe the arc 3, which intersect by an arc struck from 2 as center with 2° 3 in L as radius. Now with 2 in J as center and 2° 4° in A as radius describe the arc 4 in J, which intersect by an arc struck from 3 as center and 3° 4 in L as radius. Proceed in similar manner for the balance of the pattern, using alternately, first the divisions on the miter cut 1° 11° in B, then the proper numbered slant line in L, the divisions on the miter cut 2° 12° in A, then the proper numbered slant line in L, until the last line, 11 12 in J (which is obtained from 11 12 in the side view), is obtained. A line traced through points thus obtained, as shown by 1 2 12 11 in J, will be the pattern for the side E. In precisely the same manner obtain the pattern for side F.

Shaffer on Strikes.

A mass meeting of members of the Amalgamated Association of Iron, Steel and Tin Plate Workers was held in Youngstown, Ohio on Sunday afternoon, January 19. Members of lodges in the Mahoning and Shenango valleys were present, and the principal address was made by Theodore J. Shaffer, who is president of the Amalgamated Association. In referring to the strike of last summer, which ended in a disastrous defeat for organized labor, Mr. Shaffer said: "I am opposed to strikes, and declare to-day that in the one last summer both sides got more than they wanted, and there will not be another." Mr. Shaffer said that when the strike started the association had $72,000, had paid $200,000 in strike benefits and at present there was a balance of $100,000 in the treasury.

FLASHINGS.

The annual meeting of the American Tin Plate Company was held in Jersey City, N. J., on January 21. It was stated that only routine business had been transacted. The company announce that they cannot take any more orders for January delivery. Many mills, the erection of which was begun last year, are nearing completion and this will shortly increase the company's capacity.

Joseph Hilton has resigned as superintendent of the Cambridge Rolling Mill of the American Steel Sheet Company and the mill is now under the general management of Alexander Robins. It is expected that the Cambridge Rolling Mill will start up in about a week or ten days.

It is reported that the American Tin Plate Company are contemplating the dismantlement of their plant at Atlanta, Ind. It is said that the Atlanta mill may be removed to Elwood, Ind.

The building of the new plant of the Ohio Mfg. & Galvanizing Company at Niles, Ohio, is proceeding steadily and it is expected that the works will be in operation within a short time.

The incorporators of the Cadwalader Tin Plate & Metal Company, who will apply for a charter on January 28, are George A. Cadwalader, Joseph Cowley, H. Good, Samuel Hunt, Charles A. High and H. S. Loughrey. The company propose to manufacture Iron and Steel Sheets and Tin Plates.

The Springfield Cornice Works have secured the contract for the Metal Work on a new block which is being built on Essex street, Springfield, Mass., for Edward Radding.

It is understood that the American Can Company propose to follow the policy of gradually centralizing their factories, thereby curtailing expenses and promoting efficiency of manufacture. By April 1, it is said, their 60 plants will have been reduced to 45 by the closing down and dismantling of some of the smaller and less favorably located factories.

The old Niedringhaus rolling mill of the National Enameling & Stamping Company in St. Louis, Mo., the destruction of which by fire was reported in our last issue, will be replaced by a modern steel structure, work on which will be begun as soon as the debris of the old plant can be cleared away. The mill that was burned was the oldest of all the mills of the former St. Louis Stamping Company, having been built in 1879. The fire was caused by the boiling over of a grease pot, and the building, a wooden structure, 120 x 180 feet, covered with corrugated iron, was totally destroyed, involving a loss to building, machinery and stock of about $75,000, fully covered by insurance. It was with difficulty that the plant of the Buck's Stove & Range Company, adjoining the mill, was saved from catching fire also.

The G. Drouve Company, Bridgeport, Conn., have taken the contract for the Galvanized Iron and Copper Work on the new Meigs Building in that city. They have just completed the Cornice for the large Taylor Building.

The Wheeling Roofing & Cornice Company, Wheeling, W. Va., are said to be preparing to build a large plant at New Martinsville, W. Va., and to remove their Wheeling establishment to that place.

The Edwards Mfg. Company, Cincinnati, Ohio, have increased their capital stock to $20,000, and are now manufacturing at their Cincinnati plant a complete line of Conductor Pipe, Eave Trough, Wire Hangers, &c. The company's plant in Covington is given up to the manufacture of Ornamental Stamped Work, Cornices, Statuary, Zinc, Copper and Spun Work. The company report an excellent demand for their product. The office of the company is now located at 119 Lyceum street, Cincinnati, Ohio, where E. W. Edwards, the president and treasurer of the company, makes his headquarters. Mr. Edwards was formerly connected with the Reeves Mfg. Company of Canal Dover, Ohio.

The Newport Rolling Mill Company, Newport, Ky., are completing the plan of the three new finishing mills and two cold rolling mills, which they expect to have in operation about the middle of next month. With the installation of this additional machinery the company will be able to roll Steel Sheets of sizes from No. 10 gauge up and as large as 42 inches wide and 120 inches long. The mills of the concern have been running steadily for the past year and they are full up with orders covering the first quarter of 1902. So large has been the demand for their product that they have been obliged to turn down a considerable number of orders in their roofing and corrugating departments during the past three months.

Theodore Pratt of the Sheet Metal department of the Canfield Supply Company, Kingston, N. Y., has gone to Belgium on a visit to his old home, after an absence of ten years. While abroad Mr. Pratt will look after some matters of business for his employers.

Representatives of Amalgamated lodges and other labor organizations in the Wheeling district met on Sunday, January 19, to arrange for the national convention of the Amalgamated Association, to be held in Wheeling in April next. The Board of Trade of Wheeling will co-operate in providing finances.

It is reported that the Barrett Mfg. Company, New York, Chicago and other important cities, have absorbed their strongest competitor in the West, the Union Coal Tar & Chemical Company, Chicago. Well informed Chicago authorities are of the opinion that a large sum was cleared by the latter company on the transaction. It is also rumored that options are held on the other large competing plants in this line—that is, Tarred Roofing Felts and other Coal Tar products used in roofing and paving. If these plans are carried into effect it is quite possible that a sharp advance in goods of this character may be made. Manufacturers of Red Rosin Sized Sheathing held a meeting in New York January 21 and the presumption is that prices on this class of material will also be advanced.

The statement that the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, makers of Wrought Iron and Steel Sheets and Pipe, Black and Galvanized, were rolling scrap from which to make Sheets to cover their buildings is incorrect. When their buildings were being erected they endeavored to purchase pure Puddled Iron Sheets free from scrap, but were unable to do so. Failing in this, they decided to make Puddled Iron Sheets in their own mills for covering their buildings. This concern will make a specialty of the manufacture of Puddled Iron Sheets for the open market free from scrap.

Several new lodges of the Amalgamated Association of Iron, Steel and Tin Workers have been organized in the Mahoning Valley district during the past week. A number of new Sheet mills have recently been started in the Youngstown district, and the new lodges have been formed among the employees of these new mills.

The Tucker Mfg. Company of Newark, Ohio, have incorporated, with $50,000 capital stock, to manufacture Black and Galvanized Steel Sheets into various products. John Tucker, O. M. Tucker, J. R. Tucker, Charles Kibler and Edward Kibler were incorporators.

The Eighth Annual Meeting of the American Society of Heating and Ventilating Engineers.

The opening of the eighth annual meeting of the American Society of Heating and Ventilating Engineers found a good representation of the membership in attendance. The meeting was called to order at 2.30 p.m. on Tuesday, January 21, at 12 West Thirty-first street, New York, by the president, J. H. Kinealy. On calling the roll, the following members were found to be present. In addition the meeting was attended by a number of others interested in its papers and discussions:

List of Members.

J. H. Kinealy,
A. E. Kenrick,
W. M. Mackay,
C. B. J. Snyder,
John Gormly,
S. A. Jellett,
A. G. Paul,
W. S. Washburn,
H. A. Joslin,
Newell P. Andruss,
Henry B. Gombers,
Charles R. Bishop,
Frank K. Chew,
W. H. Switzer,
A. C. Edgar,
Mark Dean,
F. N. Thomson,
H. J. Barron,
W. H. McKiever,
Wiltsie F. Wolfe,
J. J. Blackmore,
Warren Webster,
H. Adams,
L. B. Sherman,
A. S. Hamlin,
John A. Payne,
Thomas Barwick,
Andrew G. Harvey,
John A. Connolly,
Enoch Rutzler,
Richard Hankin,
B. F. Stangland,
Harry Ritter,
John Hopson,
Wm. Kent,
H. A. Smith.
B. H. Carpenter,
F. P. Blodgett,
A. S. Mappett,
A. H. Fowler,
R. C. Carpenter,
J. A. Goodrich,
G. O'Hanlon,
A. A. Carey,
C. F. Hauss,
James Mackay,
A. A. Cryer,
W. A. Russell.
H. L. Anness,

Guests.

Martin L. Kaiser,
John C. F. Trachsel,
C. P. Vanderveer,
B. F. Hurd,
Frank Dobson,
J. George Klemm, Jr.,
Conway Kiewitz,
L. W. Atwater,
C. E. Oldacre,
R. R. M. Carpenter,
A. B. Franklin,
W. W. Macon,
Clarence M. Lyman,
Henry A. Gouge,
L. D. Collins,
J. C. Faulkner,
W. L. Clark,
Charles A. Geoghegan,
J. G. Marsh,
C. S. Mulford,
Elmer Phelps,
L. O. Koven,
G. H. Koven,
John A. Fish,
R. M. Stockwell,
Douglas McCallum,
A. W. Ross,
John M. Bruce,
C. H. Corbett,
Roy Quay,
M. E. Philbrick,
A. Boring.
C. C. Finkler,
T. R. Schenck,
J. Leland Wells,
A. A. Ray,
J. H. Lindsay,
Henry R. Marshall.
W. A. Lawson,
H. W. Jones,
E. R. Burroughs,

The president then made the following address:

President's Address.

It is my privilege as well as my duty to address you to-day upon matters of interest to the society. I do not propose to confine my remarks to those things pertaining to the present condition as to members or money of our society, because of these you will learn from the reports of the secretary and treasurer, and as to what work has been done during the past year by the committees you will learn from the reports of their chairmen. I propose to speak to you to-day of the heating and ventilating engineer and his work.

During the first half of the nineteenth century engineers were classed under two heads—military engineers and civil engineers. The military engineers were those who did work of an engineering character in connection with military operations. They built forts, military roads, bridges and other structures whose primary use was for military operations, for facilitating offensive and defensive movements. Military engineers were, as a rule, soldiers first and engineers second. Under the head of civil engineers were classed all those men who had to do with engineering work which did not pertain to military operations. All engineering work of whatever character which was civil and not military was done by the civil engineers.

Toward the middle of the nineteenth century the civil engineering work became so varied and diversified that engineers other than military engineers were classed under two heads—namely, civil and mechanical engineers. Civil engineers were those who built structures which were at rest, structures such as bridges, buildings, viaducts, sewage systems, water works, &c. Mechanical engineers were those who built machines, objects which were to be for the most part in motion. They built steam engines, machinery for factories, locomotives, steamships, &c. The civil engineer had to do largely with that part of mechanics called statics, while the mechanical engineer had to do largely with that part called dynamics. Later each of these large branches—civil and mechanical engineering—was subdivided into a number of smaller divisions, and the engineer who did work pertaining to one of the smaller divisions was termed an electrical engineer, a sanitary engineer, a steam engineer, a bridge engineer or a structural engineer, depending upon the branch of work in which he was engaged.

Among the latest of the engineers to acquire a distinct title was the heating and ventilating engineer. The heating and ventilating engineer does work which is largely that of the mechanical engineer. It is his duty to supply the occupants of buildings with heat to keep their bodies warm during cold weather and with fresh air for the preservation of their life and health. The heating engineer should be a mechanical engineer. He should know about engines, boilers, steam piping, shafting and other things about which the mechanical engineer must know; and in addition he must have, to a certain degree, that kind of knowledge which a physician has, in order to enable him to determine what are the effects of too high or too low a temperature upon the human body, what are the effects of too great or too small an amount of moisture in the air breathed by human beings, and what are the effects of impure air upon the health and well being of the occupants of rooms. He must know these things not only from the standpoint of the physician, but also from the standpoint of the engineer; from the standpoint of one who, knowing the good or bad effects of certain things, is capable of devising means by which the bad effects may be eliminated and the good effects only preserved. He must know these things in such a way that he can appear before a board, consisting entirely of laymen or of laymen and physicians, and be able to tell them what things are necessary for the proper heating and ventilating of a structure in order that the persons occupying this structure may live in it with comfort and convenience, and without detriment to their health. He must be able to give reasons for this thing and for that thing; he must be able to overcome the ignorance and prejudice of the unlearned, and, further, he must be able to point out how to obtain those things which he says are necessary to the comfort and health of the occupants. When telling what is necessary he must act the part of the physician, and when telling how to obtain these things he must act the part of the engineer. There are to-day many physicians who, either through old fogyism or lack of broad training, do not know what they should, or at least do not advocate what should be advocated for the proper ventilating and heating of schools, hospitals and other buildings in which large numbers of people are to be congregated for a considerable period of time. These physicians the heating and ventilating engineer must be able to meet on the plane of a physician; he must be able to talk intelligently and in such a way that the physician will understand, and he must be able to convince the physician that he knows what he is talking about and is right in what he says; or he must at least be able to convince those who have the deciding voice in the question of how a building shall be heated and ventilated. Having convinced the physician or others as to what shall be done, the heating and ventilating engineer must then become a mechanical engineer, and must be able to discuss with intelligence and force the proper and most economical method of generating heat by the combustion of fuel, of transmitting this heat from the point of generation to the point of use, and the method or means by which this heat is to be made available for the heating of the building; he must be familiar with the operation of engines and electrical machinery in order that he may choose the proper motor for running the fan or other device for supplying air to the building to be ventilated, and he must know the laws which govern the flow of air and steam through pipes and flues.

It may seem that I am requiring in my assertions a large amount of knowledge for the heating and ventilating engineer, an amount of knowledge which few of us can claim to have. While I think that this is true, and while I think that there are a few of us who know as much as, in my opinion, a heating and ventilating engineer ought to know, still I do not think that I am

setting the standard of knowledge at all too high; nor do I think that the standard I am setting is one which, in a few years, will not be reached by all heating and ventilating engineers who will stand in the first rank of their profession.

It must be remembered that the heating and ventilating engineer is a distinct outcome of a long evolution. The first men to study and agitate the question of heating and ventilating were hardly engineers—they were physicians. They knew what ought to be supplied to buildings in the way of warmth and air, but they did not know how to best attain the results which they sought. These men gave to others, to men who were engineers, simply their ideas as to what should be obtained and left to those other men the work of devising means for obtaining it. These physicians, as I have said before, were in no sense engineers, and the engineers who carried out the ideas of these physicians were in no sense physicians. The result was that there were two classes of men working together—the one who knew only what was desirable and what should be striven for in the way of heating and ventilating; the other who knew nothing of heating and ventilating from the physician's standpoint, who knew only of engines, boilers and machinery, and who simply carried out the dictates of the first class. Each of these classes was mutually benefited by its contact with the other. The physician acquired a knowledge of what could be done from the engineer, and the engineer acquired a knowledge of what should be done from the physician. As a result of this intercourse between the two classes there has sprung up the class of men whom we now call heating and ventilating engineers. And to-day we have in this country many men who know what ought to be done, and who also know how to attain the results desired; men who are learned in that they have knowledge, and who are wise in that they have knowledge and know how to use it. These men have studied heating and ventilating from the standpoint of the physician and also from the standpoint of the engineer.

To-day physicians are working upon the problems met with in heating and ventilating and are attempting to solve those which are solely problems of physiology or hygiene, and engineers and physicists are working upon those problems which belong to the domain of engineering and physics. The heating and ventilating engineers are by a process of natural selection and evolution becoming divided into three classes. The first class comprises those men who are working, experimenting and studying the experiments of others, to determine what results should be obtained in a properly heated and ventilated building. They are men who, while engineers, are studying the works of physicians and are studying with physicians to determine the effects of high temperatures upon human beings, the effects of low temperatures, the effects of moisture in air, the degree of impurity which results from the breathing of air by human beings, and other questions, which, while they have been studied for many years, are still unanswered and about which there is yet much to be learned. To this class belong also the physicians, physicists and scientists who are studying heating and ventilating almost as an abstract science. To the men of this class is due the progress of heating and ventilating as a science.

The second class consists of those men who partake in their make up and training more of the engineer than the physician or the physicist, and who consider only the means to be used in carrying out the wishes of the first class, who devise apparatus for heating buildings and apparatus for ventilating buildings; men to whom we must look for those improvements in heating and ventilating devices which will enable us to properly and economically heat and ventilate buildings. To this class belong those who design, construct and erect heating and ventilating plants, and also those men who invent new systems and new apparatus for heating and ventilating. To the men of this class is due the progress of heating and ventilating as an art.

The third class consists of those men who partake of the nature of the men of both the first and second classes; those men who, on account of their training and scientific knowledge, are able to judge of the questions of heating and ventilating largely from the standpoint of the physician and physicist, but who also, on account of their practical engineering knowledge and training, are able to judge of the devices used in the art of heating and ventilating. To this third class belong largely those men who devise the rules, formulas and tables upon which all or nearly all calculations pertaining to heating and ventilating work are based. The men of this class are the connecting link between the men of the first and second classes, and are helpful to both. They collaborate, compare and study the work of the men of the first class, and, having separated the wheat from the chaff, transmit the results of their labors to the men of the second class. Through their work the science is reduced to an art and the art to a science.

In this country there are few men, or, I should say, few heating and ventilating engineers, who are making experiments or working with a view to determine what results should be attained in a well heated and ventilated building. Nearly all of the heating and ventilating engineers of this country are working toward means of attaining those results which physicians or engineers in other countries tell us should be attained in well ventilated buildings. In other words, there are few in this country, few even of the members of the American Society of Heating and Ventilating Engineers, who belong to what I have termed the first class of heating and ventilating engineers. Nearly all of us belong to the second class. That is, nearly all of us are concerned in devising means for carrying out work, for heating and ventilating buildings as others tell us they should be heated and ventilated. There are a few who make experiments, and there are fewer still who use their own experiments or the experiments of others, in order to formulate rules or equations to be used in designing and laying out heating and ventilating plants. In Germany I think it may be said that there are more men who concern themselves with what results should be attained in a well heated and ventilated building than there are men who concern themselves with the devices required to attain these ends. That is, there are more men who are experimenting and working to find out what should be attained than there are men who are working and experimenting in order to determine how to attain these ends. In this country the heating and ventilating engineers are hardly scientific enough. They are scientific only in the adaptation of means to an end. They are not scientific in their search for the end. In this country our engineers are too practical, they lean more toward the devices used to attain the end than toward the end itself. But it has been this tralt in the heating and ventilating engineer of the United States which has enabled us to make such rapid strides in the art and to forge so far ahead of other countries in the attainment of well heated and ventilated buildings. In Germany I think that they are too scientific in their search for the end to be attained and not practical enough in their use of machinery or devices to attain this end; too much time is given to the science and not enough to the art. In England I believe that the engineers are behind the engineers of either this country or Germany. So far as I can gather, they seem to be followers only. They do not seem to be making experiments to determine either what results should be attained in a well heated and ventilated building, or experiments to determine how best to attain those results which should be attained. There are few of their engineers who are prominent in either the science or the art of heating and ventilating.

As this society was the first society of heating and ventilating engineers in the world, and as it has been followed by the formation of societies of heating and ventilating engineers in Germany and England, so I think that the work of the heating and ventilating engineers in this country stands first and ahead of the work of the heating and ventilating engineers of any country. And while we may pride ourselves on this fact—and fact I think it is—we must not forget that in order to hold this powerful position we must work, and work not alone in one line. We must work in the science as well as the art of heating and ventilating. We must experiment and determine what results should be obtained in well heated and ventilated buildings, and then we must continue our work to determine how best to attain those results. We must have engineers or experimenters who will determine the effects of temperatures, the effects of humidity and the effects of impure air upon the human system; we must have engineers who will tell us how to improve the apparatus which we now use, how to attain the best results most economically and satisfactorily; and, further, we must have those men who will devote their time to the study of experiments in all branches of the science and the art, and to the working up of the experiments, in order that they may formulate the results of these experiments and give them to us in the form of rules or equations which can be understood and used by all. Without the science there will be but little progress in the art, and without the art the science is of little value. Each is dependent upon the other, and the more in harmony they are advanced the more rapid will be the progress in heating and ventilating and the greater will be the benefit derived by the human race.

The American Society of Heating and Ventilating Engineers is fortunate in being able to class among its members men who belong to the three classes of heating and ventilating engineers of which I have spoken before. The transactions of this society has been for several years in the past and will continue to be in the fu-

ture a repository of the results and information obtained through the work of its members. And it is to be hoped that the society will grow and coutinue in its place of usefulness, and that it will also broaden its sphere of work by inducing all of the many men who are working in some way or other in connection with the science and art of heating and ventilating in this country to become members of it and to put on record in its transactions the results of their experience and work. No man in this country is too big for the society, and the society is not too big for any reputable man who can aid in the least the advancement of the science and art of heating and veutilating.

New Members.

The secretary auuounced the election of the following uew members during the year:

James Curran,	Harry Lovell Anness,
J. Louis Wentworth,	William G. McPherson,
Polhemus S. Hudson,	Henry Hamelle,
Willlam C. Dean,	Wilhelm Dahlgren,
Henry Krles,	Henry A. Smlth,
Elmer E. Palmer,	William Roswell Stockwell.

The secretary's report showed an increase in membership of 12 during the year, making a total of 143 members on the roll of the association. The proceedings of the society are now regularly sent to 34 colleges aud technical societies by the secretary. The holding of a successful sumuer meeting at Chicago was reported.

The treasurer's report showed that the society had been able to meet its bills by delaying the printing of the proceedings of the last aunual and summer meetings.

The Board of Governors reported that five meetings had been held during the year and that there had been an increase in membership. The report showed that a cousiderable sum was owed by the members for dues and prompt payment of these back dues was urged, as the lack of fuuds caused by the delay in their receipt had made it necessary to hold back the printing of the aunual proceedings. The report recommended that in future the proceedings be printed more promptly; also that the constitutiou and by-laws, with list of members, be printed at the close of the meetiug. The board also reported delay in receiving the papers prepared for the meetiugs, making it impossible to distribute printed copies among the members previous to the meeting, aud urged that papers be presented earlier in future.

The Committee on Compulsory Legislation reported that bills to provide for the ventilation of buildiugs had been before the legislatures of Pennsylvania, Maryland, Michigan, Illinois and New York, and that while the bill before the New York Legislature last year was defeated the measure had beeu preseuted again this year, with a better outlook for its enactment into law.

The Committee on Tests reported offering its services to the District Attorney of the county of New York last spring for investigatiug the conditious in the tunnel of the New York Central Railroad. The Grand Jury was strongly inclined toward the use of electric traction as a solution of the trouble, otherwise the offer would probably have been accepted.

The special Committee on Professional Charges reported that after correspondence with the Institute of Architects in referencc to professional fees, the following clause was incorporated in the schedule of minimum charges by the Institute of Architects:

"Where heatiug, ventilating, mechanical, electrical and sanitary problems in a building are of such a complicated uature as to require the assistance of an engineer, the owuer is to pay for such assistance as the architect may require. Chemical and mechanical tests, when required, are to be paid for by the owuer."

On motion, W. N. McKiever, H. J. Barron and A. E. Kenrick were appointed a committee to consider changes in the membership application blank.

The president appointed S. A. Jellett, H. J. Barron and A. G. Paul as tellers to count the vote for officers. The meeting then adjourned.

TUESDAY EVENING.

The eveniug session was called to order at 8.30 p.m. by President J. H. Kinealy. The report of the tellers showed the electiou of the following officers:

President, A. E. Kenrick, Brookliue, Mass.

First Vice-President, Andrew Harvey, Detroit, Mich.

Second Vice-President, R. C. Clarkson, Philadelphia, Pa.

Secretary, W. M. Mackay, New York.

Treasurer, J. A. Goodrich, New York.

Board of Governors: J. H. Kinealy, R. C. Carpenter, John Gormly, Wm. Kent and C. B. J. Snyder.

A paper eutitled "Hospitals for Coutagious Diseases and Their Ventilation," by Thomas Barwick, presented elsewhere in this issue, was then read and discussed, as follows:

JOHN GORMLY: There should be some kind of check valves to prevent back currents in the ventilatiug flues under some conditions in hospitals where different diseases are being treated. Similar precaution should be taken with the water supply, aud the drainage systems should be subjected to a process of disinfection.

H. J. BARRON: Unfortunately the engineer is seldom consulted either by the doctors or architects in the designing of such buildings. Ideal conditions would be provided iu a system forcing fresh warm air into a hospital building and exhausting the air from the building and driving it into the boiler fire box as far as possible aud the rest of the air out into the atmosphere through an uptake shaft.

S. A. JELLETT: In such buildings the question of cost always must be considered first. The conditions are that a hospital must be of the elastic character to suit the conditions. An epidemic increases and subsides and the heating system must be adapted to these requirements. A blower system of ample capacity with sufficient size in the ducts and blower is best, inasmuch as the fan cau be speeded up as more air is needed and more sectious of the heater can be brought into use. The conditions, however, are that the large hospital with an ample heating and ventilating apparatus is never needed until an epidemic is at its highest, when it is too late to provide it, and the need often passes before it is provided. In all large cities the engineer is confrouted by the same proposition and so far it has not beeu met satisfactorily.

THOMAS BARWICK: In answer to the question of A. E. Kenrick a separate flue from the fan to each room is uot necessary where the fan is kept running. In small buildiugs for a dozen or so patients a gravity system could be nsed with efficiency and the item of cost disposed of more readily.

A. B. FRANKLIN: At the hospital at Rutlaud the State of Massachusetts has a series of one-story buildings where consumptives are cured by the fresh air treatmeut, where temperature is secondary to an abundance of fresh air and sunshine. This is largely outdoor treatmcnt, and the engineer who most nearly provides these conditions in buildings that he is called upon to heat and veutilate most satisfactorily solves the probleu.

Topical discussion occupied the meeting until adjournment.

WEDNESDAY AFTERNOON.

The meeting was called to order at 3 p.m. by the president, and opeued with the reading of the preliminary report of the Committee on Standards on a "Code for Testing Direct Radiation Heating Plants, Together With Discussion on Same at 1901 Meeting," which was then discussed as follows:

JOHN GORMLY: A time limit should be set for a test, and it should be specified that all doors between different rooms be either open or closed. A thermometer should be provided in each room.

J. J. BLACKMORE: The code presented is entirely tentative, aud is for the purpose of being discussed with a view to improvement.

WILTSIE F. WOLFE: The committee has done a commendable work in starting a discussion with a view to finally produciug a code for testing direct radiation heating plants in buildings. I hope that the members will lend their assistance to the perfection of it, and that it will then be widely distributed among the architects and others with whom the heating engineer comes iu contact. At least four thermometers should be used, and should not vary more than 2 degrees when placed not less than 2 feet from the walls in the coruers on the same horizontal line.

C. E. OLDACRE: After a plant has been in use several months a test was made, when it was found that an almost invisible crack permitted a current of air to play on

a thermometer so as to hold the thermometer at 68 degrees, whereas when the same thermometer was hung on a chandelier 5 feet from the floor a temperature of 76 degrees was recorded. More than one thermometer should always be used, as one or more are often affected by air currents. By this means an average temperature will be shown at the guaranteed light.

W. F. Wolfe: When this code is finally accepted it should be indorsed by the society, and then generally distributed as a standard method of conducting such tests.

C. R. Bishop: The society would be benefited by finally adopting a code that could be referred to as standard when it is found necessary to conduct a test. The different requirements should be specifically stated. Such a code might not be applicable in many instances, but could be modified so as to be at least valuable as a guide.

H. J. Barron: This code is not adapted to much of my work, and I doubt if it or any code can be devised that can be of even general value.

A. B. Franklin: Any code, test or contract of a heating engineer or contractor should be prefaced by a statement that the building shall be put in proper condition before the heating apparatus shall be subject to test by any code.

J. H. Kinealy: This code has been presented by the committee so that when any one is called upon to make a test of a heating apparatus this code may be used or some other. It is mandatory on no point, except as to the minimum provisions and the instruments. In all other things, the test made may be as much more extensive as may be desired, where a direct radiation plant is under consideration. This code is submitted for trial by the members to be perfected.

On motion the report was referred to the committee to be revised for further report at the next meeting of the society.

The paper, "The Temporary Warming of the Large Hall of the Royal and Imperial Palace Library, Vienna, Austria, for the Visit of His Imperial Highness, the Crown Prince of Germany, April 14, 1901," presented by Prof. Edward Meter of the Imperial Technical High School of Vienna at the meeting of the German heating and ventilating trades, and translated by Charles F. Hauss, was then considered.

W. Kent: This paper is an excellent one, and a very clear description of a large piece of work done so quickly that it would have been creditable to any American engineer. It is a character of paper that should more frequently appear at our meetings.

H. J. Barron: The paper is valuable in giving an account of actual work that can be studied with confidence and benefit. Similar papers on our own work would be valuable records for the society.

The paper on "Depreciation, Maintenance and Interest Charges," by Reginald Pelham Bolton, presented elsewhere in this issue, was then read.

W. Kent: This paper is a step in the right direction, but does not go far enough. The estimate for interest is correct, but the estimate for maintenance and depreciation is too high, as pumps and boilers will last much longer than the time mentioned as well as pipe and radiators, and a much longer time should be considered.

J. Gormly: I have samples of pipe taken from the heating system in a dwelling, where after seven years there are holes in the pipe that can be looked through. If pipe will only last seven years it would seem that the conclusions of the paper must be modified.

A proposed change in the membership application blank was referred to the Board of Governors. The report of the Committee on Uniform Contract was also referred to the Board.

Topical discussion was then take up.

The meeting adjourned at 6 p.m., to accept the invitation of the New York members to a dinner at the Arena to the visiting members.

THURSDAY MORNING.

The meeting was opened at 11 o'clock by Vice-President A. E. Kenrick.

The paper entitled "An Investigation Into the Difference Between the Coefficients for the Thermal Conductivity of Building Materials Obtained by Piclet and Those Obtained by Later Experimenters," by A. R. Beck, was then read and discussed. On motion R. C. Carpenter and J. H. Kinealy were invited to prepare a written discussion of this paper to be presented in the proceedings of this meeting.

Discussion was taken up on "What is the Advantage (or Disadvantage) of Broad Grates with Shallow Firing Over Deep Fire Boxes and Intense Concentrated Fires on Small Grates in Hot Air Furnace Heating?"

W. Kent: There is an advantage in favor of the broader grate.

M. L. Kaiser: The larger fire surface has the advantage of more efficiency and the deeper fire of requiring less attention.

B. H. Carpenter: A deep fire is conducive to waste.

H. A. Smith: Where the fire chamber is proportioned to the work some economy in labor attends the use of a smaller, deeper fire.

Clarence M. Lyman: A fire of good efficiency can be maintained in fire pots of tapering construction.

W. M. Mackay: My experience has been that a deep fire under slow combustion meets the demands of the user who wants a fire to last a considerable time without attention and yet do good work.

W. F. Wolfe: Fires that are broadest at the grate, under my observation, have advantages.

C. E. Oldacre: Some experiments made with the same upper furnace construction showed that 56 pounds of coal did the required work with a deep fire, while 104 pounds were required with a shallow fire, the other conditions being practically the same. In combination heaters the water heating surface should be placed in contact with the fire in deep fire constructions to get good results, otherwise the water heating power will be very low, except under rapid firing, when a flame plays against the surface suspended above and out of contact with the fire. A record of the temperature of the gases passing from the fire at the chimney varied according to the firing from a maximum of 320 degrees down to less than 100 degrees at times.

W. Kent: I hope furnacemen will some time arrange to test a furnace system so as to establish some scientific data on this branch of heating.

In discussing the topic, "The Tudor System of Steam Heating as Compared with the French System," as presented by M. Debesson in a paper read at the last annual meeting, the opinion was freely expressed that the various vapor systems of heating had followed the introduction of the Tudor system of heating. Discussion of the various vapor systems of heating occupied the morning session until adjournment.

THURSDAY AFTERNOON.

The meeting was called to order at 3 o'clock by the vice-president, and discussion was opened on the topic, "What is the Advantage of Flame Heat from Active Firing of Small Quantities of Coal Over Heat Radiated from Heavy Intense Fires?"

A. A. Carey: Aside from the fact that the flame often reaches points not subjected to the radiant heat of the fire, flame heat is less powerful.

W. F. Wolfe: Visible flame is generally due to imperfect combustion, and is not as strong in its heating effect as a radiant fire.

On motion, the holding of a midsummer meeting was left to the discretion of the Board of Governors.

On motion, the preparation of a base schedule for professional charges was referred to the Special Committee on Professional Charges.

A paper on "The Performance of Centrifugal Fans Under Actual Working Conditions," by H. Eisert, was then take up, but owing to the lack of time, discussion was deferred.

The new officers were installed, each being introduced to the society and accepting the duties with appropriate remarks.

Andrew Harvey spoke of the benefit to be derived from making the tenth anniversary of the society, two years hence, an occasion for a special celebration. On motion, a special committee of ten members, to be appointed by the president, was provided to devise some plan for making the tenth anniversary meeting of the society one of special interest. The president then announced the appointment of the following:

Committees for 1902-3.

COMPULSORY LEGISLATION.

W. M. Mackay, Chairman.
Henry Adams.
Andrew Harvey.
T. J. Waters.
B. H. Carpenter.

UNIFORM CONTRACT AND SPECIFICATIONS.

S. A. Jellett, Chairman.
Wm. H. McKiever.
H. J. Barron.
R. P. Bolton.
F. A. Williams.

STANDARDS.

J. H. Kinealy, Chairman.
Herman Eisert.
H. A. Joslin.
J. J. Blackmore.
Charles G. Folsom.

TESTS.

Albert A. Carey, Chairman.
Wm. Kent.
C. M. Wilkes.
James Mackay.
B. F. Stangland.

Discussion was then taken up on the topic, "What Can We Do to Impress Upon the Owners of Buildings and Architects the Necessity of Adequate Smoke Flues for Heating Apparatus?" On motion, this was referred to the Committee on Standards, with instruction to prepare a table of chimney sizes based on the requirements of water tube boilers.

On motion, the topic, "What is the Proper Proportion of Grate Surface in a Boiler to the Radiating Surface in a Building in Low Pressude Steam and Hot Water Heating," was referred to a special committee to be appointed by the president.

After the usual complimentary motions a motion for the final adjournment of the meeting was carried.

ENGINEERS' DINNER.

The New York City members of the American Society of Heating and Ventilating Engineers never dispensed a more generous hospitality than in the annual dinner to the visiting members at the Arena on Wednesday evening. This annual dinner affords an excellent opportunity for new acquaintances to be made and friendships to be established among the members, that result in an increasing strength to the society. It is by no means the least important feature of the annual meeting.

After disposing of a well selected *menu*, the members and guests enjoyed the introduction of the speakers to the various toasts, made in a most happy manner by Past President R. C. Carpenter, who acted in the capacity of toastmaster. The first speaker was A. E. Kenrick, who spoke on "The Progress of the Art in the East." Mr. Kenrick made the point that Massachusetts was the pioneer State on compulsory ventilation. W. F. Wolfe spoke on "The Extreme East; or, European Practice," applause followed the claim that American practice was in the lead. In a speech on "Heating and Ventilating Schools," by C. B. J. Snyder, the diners rose to the statement that "Our society has greatly aided improvement in this field in New York City."

S. A. Jellett, speaking on "Steam Fitters," said that "they fill the gap between the engineer and owner." W. Kent spoke on "What We Are." Applause attended the definition given: "We are the leaders of the world in this branch of industry." Andrew Harvey, in treating "Improvement in the West," made the statement, "Too busy working in the West to do any better than the best we know," which brought down the house.

H. R. Marshall's toast was "The Relation of the Architect to the Engineer." Laughter was called forth by the representation that the early Greek and French architects had a rather easy time of it in not having to contend with the heating and ventilating engineer and the other myriad complications of modern buildings. The next speaker was A. A. Carey, on "The Mechanical Engineer." After pointing out how the two branches of engineering are in constant touch, he gave an interesting account of the investigation of the condition of the New York Central tunnel, and attributed the recent disaster entirely to the lack of ventilation. H. J. Barron followed on "The Past and Present of the Society." The society's one aim, he said, was the desire to represent all branches of work, and to be open to all engaged in it in whatever capacity.

Ex-Senator Albert A. Ray spoke on "Legislation for Ventilation." Applause marked the expression of his opinion that the society was more closely engaged in work that most nearly touched the vital interests of the whole people than any other body, in its efforts to provide laws that would insure their greater health and comfort through compelling buildings to be erected so that they would be filled with fresh, pure air.

Frank K. Chew spoke of "The Press" as the invaluable and indispensable aid to all progressive steps in heating and ventilation, and all other lines in preparing the public to understand, accept and assist in the advancement of all public interests.

New York City Notes.

The assembled guests at the reception of Brooklyn Branch last Tuesday evening had their attention called to an apparently motley crowd who arrived late, each one of whom had his collar turned up and hat pulled down and with a clay pipe in his mouth, and who said they had come to give an "honest" smoke test. After being admitted they proved to be a delegation from Manhattan, headed by President I. J. Brown, and composed of Messrs Donohoe, Kirchhof, Philip Brady, T. S. Cochrane, Jr., Corkery, Renehan, Schiffer, Hill, Loeble and Clerk Lockwood. They found President A. H. Brown, ex-President Malcolm and E. J. Brady waiting for them there, and were royally entertained by the Brooklynites.

* * *

Although it was an inclement night and the two branches were holding the regular meetings, Manhattan sent its delegation as above and Queens was represented by John Anderson of Flushing, F. X. Meier of Richmond Hill and G. W. Perry of Jamaica.

* * *

Paul S. Bolger, in addition to his Mount Sinai Hospital and other work, is plumbing the new building of the New York *Press* at 11 to 15 Spruce street.

* * *

E. J. McCabe & Co. are overhauling the old McCreery Building, at Broadway and Eleventh street, which is being altered into a loft building.

* * *

The many friends of Jesse L. De Graw will be pleased to learn that he is recovering from the shock of paralysis he sustained two weeks ago.

* * *

Retrenchment in some of the city departments makes them want to do their own plumbing work. The latest to suggest such a thing is the Board of Education. The Dock, Police and Bridge departments already do some work, and unless the matter is brought to an issue there will be very little repair work for plumbers in the city departments.

* * *

The plumbers and supply men should unite in defeating the bill introduced by Assemblyman Wilds to do away with the conditional bill of sale on plumbing fixtures.

The P. and S. S. League.

On Monday night the bowlers in the Plumbing and Steam Supply League again met, and the team of the John Simmons Company retained their lead by winning both of their games, while the Ronalds & Johnson Company New York team lost two games, the F. N. Du Bois & Co. team breaking even. On Thursday night the Thomas G. Knight team lost both their games, and the Dimock & Fink Company team won two games, the Salesmen team losing one game. Both the Knight and Salesmen teams were short one man, yet the Salesmen team scored 700 in one game, to which W. Emery contributed 202 and Henry Stein 230, surpassing his former high score of 222.

DEPRECIATION, MAINTENANCE AND INTEREST CHARGES.*

BY REGINALD PELHAM BOLTON.

The comparison of certain different apparatus, the relative economy of competing devices and the value of improvements, are affected directly by the empirical amounts chargeable against them as interest, maintenance and depreciation.

A common and very crude method appears to be to fix each item in such computations at a rate of 5 per cent. In the course of discussions with representatives of power and heat supply companies desirous of applying their systems to certain buildings, I have been confronted with an assertion that depreciation alone should be charged on independent power and heating plants at the rate of 8 per cent., and that interest should be charged upon the whole cost of the installation at the rate of 5 per cent., additional to maintenance at 5 per cent. I have as a result of these varying and apparently haphazard figures been led to make some inquiry into this question, and venture to think some conclusions gained from New York circumstances will be of interest to members of a society especially connected with the design and installation of operating machinery and appliances necessary to life and comfort.

INTEREST.

In the city of New York the rates of interest on borrowed money vary, of course, with the nature of the security. In the case of buildings and factories the form of security is commonly a mortgage. First mortgages are usually obtainable up to 60 per cent. of the value of the property, and in Manhattan Island at present a rate of interest of 4 per cent. can be obtained, or in certain centrally situated properties one-half of 1 per cent. lower.

The value of some land is so great that a 60 per cent. mortgage upon its value will suffice to erect and equip a very considerable building upon it, but where this is not the case, an owner borrowing six-tenths of the cost of his building on first mortgage may borrow the balance, if he be in good credit, at as low as 5 per cent., of banks, on note, bond or second mortgage.

In a close computation, therefore, it should be ascertained what rate of interest the money represented by a plant involves, but where the information is not obtainable it may be assumed that the rate of interest does not exceed 4 per cent. on six-tenths and 5 per cent. on four-tenths, or a mean of 4 4-10 per cent.

MAINTENANCE.

This is compounded of several elements. Cost of upkeep, replacement and precautionary measures. A reasonable amount of care must be assumed in keeping the apparatus in operating condition. Replacement provides for renewal of working parts, and painting of perishable or exposed material. Renewal of inherently renewable materials, such as packing, comes under this heading. By precautionary measures I understand all such steps as require to be taken in good time to obviate in advance the effects of age or decay.

Naturally such items vary very considerably with all kinds of apparatus, and must be taken into separate consideration.

The cost of maintenance, therefore, varies too widely to be stated as a fixed element, but must be estimated for different apparatus by the results of experience and careful foresight. In a very general way 1½ per cent. on the prime cost of a heating and ventilating plant should suffice to cover the above items and on operating machinery 2 to 4 per cent., according to conditions.

Repairs, assuming the term to deal only with accidental damage or breakage or discovery of defects, can be properly covered by insurance or by civil suit, and, if not, are to be assumed as an unknown risk. They are not a part of maintenance.

DEPRECIATION.

This is a charge which is calculated to represent the gradual deterioration of a plant, resulting in its eventual wearing out. In certain cases it has been assumed also to represent the superannuation of a plant, or, in other words, its loss of competitive power by reason of the advent of improved appliances.

In a general way I consider both these elements are overestimated. It is common to have a sweeping limit of 10 or 15 years assigned as the life of a plant, on one or other of the above grounds. While the policy of clinging to antiquated and unproductive machinery is not in consonance with modern ideas of profitable operation and is not here recommended, it must be pointed out that it is not an argument against assigning a reasonably long life to any apparatus, that its use may be found sooner or later to be less economical than improved apparatus. Such improved appliances will, if sufficiently economical, justify in their results the entire renewal of the existing plant at an earlier date than assigned to it, and the cost of such extinguishment or partial discontinuance is to be borne by or to become chargeable against the results attainable with the improved plant.

New methods may come into existence at any time and cannot be reckoned with as a fixed element in computing the useful life of any apparatus.

Again, the possibilities of remodeling are, in the case of such apparatus as the members of this society are concerned in, very often capable of renewing the life of the perishable portions of installations.

Experience in the remodeling of old plants goes to show that even in such machinery as was built a quarter of a century ago the life of rotating machinery is greater than 20 years, while in boilers of the water tube type, piping chimneys and much of similar apparatus it may be taken at 25 years. Pumping and hoisting machinery of similar age is quite common, in all cases assuming reasonable care and reasonable renewals, for which, as before asserted, separate charges are, of course, to be made.

From the above considerations it may be gathered that in the case of a modern private commercial power or heating plant an assumed life of from 15 to 25 years, varying with the nature of the appliances, is proper, and for the purpose of ready calculation a mean of 21 years can safely be taken.

It is not to be supposed that an owner will regularly lay by annually a sum equal to the amount charged as depreciation, or take the trouble to arrange for its investment and the investment of its interest. It would not, in fact, pay him to do so, because the money is worth more to him in his own business than he could obtain at current rates in the market or savings banks. In practice it is therefore retained in his business or investments, and is earning the rate of interest obtainable therein. In a majority of instances where the business in which the machinery is employed is an actively constructive or manufacturing one, the assumed amount of depreciation is really earning very high rates of interest, often more than 25 per cent. per annum. Under not uncommon commercial circumstances, therefore, the assumed depreciation fund may very moderately be credited with an earning capacity of 10 per cent. compound intrest. With a life of 21 years and a rate of compound interest of 10 per cent. the charge of depreciation becomes only 1½ per cent. upon the capital outlay.

It will be evident how important is the consideration of these standing charges in deciding the relative economy of machinery, but it is seldom that they are properly applied. We often learn of the adoption of apparatus designed to effect a certain economy, the cost of which, if debited with its proper charges, would outweigh the ascertained economy, and which is therefore being operated at a loss. This is particularly the case in the numerous devices for coal saving in boilers, and guarantees of a certain result are apt to be considerably counterbalanced if the proper charges are applied.

An illustration may be taken from a case recently considered in detail:

A high duty pumping plant was offered for a large elevator service with a guaranteed saving of 15 pounds of steam per horse-power of water pumped per hour. Careful estimates showed a probable saving in fuel of $1500 per annum by this apparatus, the additional cost of which amounted, however, to $19,000.

In case the life of the two pumps involved is taken at 20 years, and the rates of interest are as herein stated, the extra capital outlay is to be charged with

Interest, 4 4-10 per cent.	$836
Depreciation, 1½ per cent.	285
Maintenance, 3 per cent.	570
Additional oil.	70
Total	$1,761

showing that the pumps will be run at a loss of $261 per annum, which capitalized at 4 4-10 per cent. represents a sum of nearly $6000. By applying the charges to the saving guaranteed it will be seen that the saving justifies only a capital outlay of $16,780. Therefore to show any gain the cost of the improvement must be less than that figure.

* Paper read at the eighth annual meeting of the American Society of Heating and Ventilating Engineers, New York City, January 21-23, 1902.

FRED. FOX, JR., president of the Tennessee State Association of master plumbers, has been visiting the cities of Memphis, Nashville, Clarksville and Murfreesboro, for the purpose of organizing associations of master plumbers in those cities. He was accompanied by some of the members of the Chattanooga and Knoxville associations, to aid him in the work.

HOSPITALS FOR CONTAGIOUS DISEASES AND THEIR VENTILATION.*

BY THOMAS BARWICK.

Hospitals for contagious diseases should be built of fire proof materials. The cruciform plan should be considered as the best for such a building, or they should be built with provision for the administrative portion at the center and radiating wings for the wards and sick rooms.

The building should be arranged so that at one point, either front or rear (preferably the rear), the reception of the patient may be provided for without being brought in contact with the administration offices of the building. Arrangement should also be made so that the patient may be quickly transported to the various wards or confining rooms, either by means of an elevator or graduated stairway, without passing through any of the administration portion.

The design for such a building would be two stories in hight, the sick wards being placed on the upper story and the convalescing wards or rooms on the first story. The basement portion of the administration part of the building should be arranged to receive the mechanical plant for the heating and ventilating and other requirements, the wings being left for the heating and ventilating ducts, &c.

The first story of the administration portion should be arranged for the administration uses only, the second story for operating rooms, &c., in connection with the wards. The floors throughout the building should be of granolithic; the walls on the inside should be of glazed brick, terra cotta, or tile, so that they may be washed down at any time. Partitions should be constructed in a similar manner, and the doors and window sash should be made of iron, or covered with metal, and as little paint as possible should be used in the building.

The first floor should be arranged with individual rooms or double occupant wards. In no case should the wings extend beyond six beds in depth, allowing for 12 occupants in the ward, with a preference for smaller wards than the above, so as to isolate the different diseases as far as possible. There should also be a preference for wards on the second story with ante-rooms, baths, toilets, &c., arranged adjoining the administration portion, and separated by proper closed vestibules. The building should also be provided with its own domestic machinery, such as cooking, laundry appliances, &c.

Such a building should be built with proper elevation above the surrounding country to give it a free and clear drainage from any surface water that may interfere with its foundations or percolate through the floor of the basement.

The heating and ventilating apparatus should be confined to the basement portion in the wings. The building should be arranged to be warmed by a system of heating stacks placed on standards and inclosed in galvanized iron at the foot of the vertical flues in the basement, and arranged with double dampers, so that at any time if a higher temperature is required in one room or ward, the same can be secured through the medium of warm air, the air passing into the various rooms through large plain fretwork grills. Each room should have a thermostat with a wide range, so that the temperature may be maintained to suit the conditions.

The air supply should be brought from a point as far from the general building as possible, so as to provide for uncontaminated air, and should be forced through the rooms by means of a blower driven by any motive power that may be adapted to the work.

The air supply for such a building should be carried up in the walls through terra cotta flues enameled or glazed on the inside so as to be germ proof as far as possible, terminating in the rooms at a point, say, 8 feet above the floor line, so as to provide for the distribution of air through the rooms without drafts upon the patients, and in the wards the inlets should be as near as possible between the beds.

The velocity of air entering into the rooms should be extremely low, if possible not over 250 feet per minute for any current of air entering the room, and should be tempered at the inlet of the fan by means of a tempering coil controlled by thermostats to a temperature of 65 degrees maintained by thermostatic regulation, and the additional heat supplied by the stacks at the foot of the flues.

The fan for doing this work should be constructed so that there will be no noise, and should be of large size so as to run at a low velocity. The arrangement of the heating apparatus, including the piping, radiators, tempering coils and the boiler, should be of ample size to maintain the building at 70 to 75 degrees under all conditions of weather, with sufficient reserve in all of the indirect stacks used as reheaters to increase the temperature in any room from 80 to 85 degrees. The boiler capacity for domestic use should be provided as well as for the heating. This could be accomplished by means of two boilers, and as far as possible there should be a duplication of parts of the system, so that should any portion of the apparatus become out of order it would not necessitate the closing down of the building.

In supplying air to such a building it is necessary to have a very large volume, so that the percentage of vitiated air will be kept to a very low degree. For buildings of this class I should recommend not less than 5000 to 6000 cubic feet of air per hour for each occupant—that is, to each individual in a room. The administration portion of the building could have slightly less than this amount, but my preference would be for the full volume throughout all portions of the building.

The vitiated air from the various rooms should be collected through vertical flues carried down to the basement, connecting into sealed ducts formed of brick or terra cotta, and the inside of each flue should be enameled or finished in similar manner to the heat flues. Each wing should be entirely independent of the other, and the vitiated air ducts connected into vertical uptake shafts (or they may be carried down to one central point to a vertical shaft), carried far enough above the top of the building, so that the discharge from the shaft will not contaminate the air in the neighborhood.

The vitiated air should be collected into a receiving chamber at the foot of the vertical uptake shafts or shaft and passed through a disinfector, in which the air should be burned, either by means of a coke fire or a furnace especially designed or by highly heated steam coils, a jet or spray of steam being introduced into the chamber so as to destroy the disease germs as far as practicable, in the same manner as clothing is disinfected by means of steam disinfecting chambers, or the air could be passed through one of the well-known disinfecting tanks that are at present in use in various parts of the country. By these means we may be able to destroy the live germs passing through the air.

Sweepings and dust from these rooms should also be conveyed to this vertical uptake shaft, either by means of a blower or by an induced draft in the vertical shaft. Perforated steam pipes could be introduced in the main air supply ducts and in the vent ducts and vertical flues where possible, so that the entire space may be flooded with steam. Humidifiers should be placed in each room and automatically regulated. The windows in such a building should be sealed in such a manner that they cannot be opened to the outside air, dependence being placed upon the heating and ventilating apparatus.

Provision should also be made for the fumigation of the rooms by such means of fumigation; by Formaline or other disinfectors as are at present in use and found adaptable. Each room could be separately treated through the supply and vent flues by using proper dampers.

Water should be introduced (both hot and cold) into each of the wards and rooms, so that the walls, ceilings and floors may be thoroughly washed down. As far as possible, the ventilation from the rooms would be best if taken near the floor, as the tendency for the heavier bodies and small particles of clothing, &c., is to settle at the floor line; therefore, they will be conveyed by the air current to the various outlets and thence to the disinfecting chambers. Clothing should be thoroughly disinfected in disinfecting chambers placed in each of the wards or wings before being taken to the laundry, these chambers being located at some point accessible to each ward independent of the administration portion of the building.

Such buildings can be built in cities where the population is crowded, or situations that are of limited area in their districts, without fear of contagion to any portion of the surrounding country.

Some of the buildings that I have investigated have been frame structures, many of them being supplied with simple direct heating apparatus, the radiators being placed in the rooms, and no proper provision being made for the supply of fresh air or ventilation. The studding of the building was constructed of wood and plastered, with the idea that the occupancy of the building would be temporary, and so that at any time the building may be burned or destroyed; but the general run of these buildings have been in use from 12 to 13 years. Through improper care and lack of funds the buildings have become permeated with vermin and bacteria, and as the buildings are constructed with no proper provision for ventilation or supply of fresh air, they are entirely unfit for the purpose designed. Some of these buildings have small ventilators placed in the ceilings, connected with cowls on the roofs, emptying into the surrounding air without any provision to destroy the germs in the vitiated air, and allowing the same to escape to the surrounding atmosphere, thus creating an actual nuisance.

In buildings for this use it should not be considered

* Paper read at the eighth annual meeting of the American Society of Heating and Ventilating Engineers, New York City, January 21-23, 1902.

that the cost of construction or cost of operation is the first requisite for such a building. The general health of the public should be considered first, and above all other circumstances. The cost of maintenance of such buildings as before described will be considerably beyond the cost of those that are now constructed in some parts of the country, but the menace to the public health where the cheaply constructed buildings are used is a constant dread at all times; therefore, I should recommend that for contagious diseases buildings should be constructed with proper ventilating requirements, and so that they may be entirely fumigated and cleaned without any possibility of contamination.

ASSOCIATION NEWS.

Wisconsin State Master Plumbers.

The eighth annual convention of the Wisconsin State Association of Master Plumbers was held in Milwaukee on January 14 and 15. The meeting was called to order by President Dengel, with a large attendance from all parts of the State. The time of the convention was devoted to the development of plans for trade protection along the lines of the Cleveland Resolutions. The association has concluded a local agreement between the manufacturers and jobbers, for the purpose of securing protection against the "skin" plumber and the "jerry" builder. The advisability of a State organizing officer was also discussed. On taking up the election of officers the following were elected for the ensuing year:

President, Frank R. Dengel, Milwaukee.

Vice-President, C. W. Nelson, Neenah.

Treasurer, George Kraft, Madison.

Secretary, Hugo Lippert, Milwaukee.

Delegate to Interstate League, L. R. Stollberg, Milwaukee.

Delegates to National Convention, H. Raymond, Racine; W. H. Halsey, Milwaukee.

Alternates, W. P. Wray, Green Bay, and C. W. Nelson, Neenah.

The invitation to hold the next convention at Milwaukee was accepted. The delegates were entertained at a theater party and a banquet, at which National Vice-President Charles Polacheck acted in a most happy manner as toastmaster. His remarks included an eloquent tribute to the National Association.

Illinois Master Plumbers.

The tenth annual convention of the Master Plumbers' Association of Illinois was called to order in the auditorium of the City Hall, East St. Louis, on January 20 by President J. M. Dougherty of Ottawa, Ill. The session lasted two days, closing on January 22 with a banquet and election of officers. The following were elected to serve for the ensuing year:

President, J. Boyd of Chicago.

First Vice-President, E. B. Hazen of Peoria.

Second Vice-President, J. D. Blake of Aurora.

Secretary, William Redieske of Chicago.

Treasurer, John C. English of East St. Louis.

Delegates to the annual convention at Atlantic City, N. J., were also elected. The next annual convention of the Illinois Association will be held in January, 1903, at Rock Island.

Where Is Walter F. Bolger?

At the request of Paul S. Bolger, a plumber, 378 Park avenue, New York, we present the following notice of the New York City Police Department, hoping that any one who can assist the father and mother in finding their son will lend their aid. Mr. Bolger offers a reward of $500 for information that will lead to the return of the boy to his home:

Walter F. Bolger disappeared from his home, Yonkers, N. Y., on Thursday, November 19, 1901, taking the 11.30 train to New York City, and has not since been seen or heard from.

He is 18 years old, but may be taken for older. Hight about 5 feet 11 inches, medium built, broad shoulders, stands erect. Weight about 178 pounds. Wears No. 8 shoes. Blue eyes, heavy light brown hair, parted near center; fair, clear complexion, of a retiring disposition, is very intelligent and quite fond of reading, particularly magazines. In conversation would be likely to discuss matters not usually interesting to boys. Does not smoke or drink. Might frequent theaters.

When he left here he wore the following garments: Light soft hat, light band; Oxford gray overcoat (coming to the knees); dark mixed gray suit, pants, vest and sack coat (of herring bone stitch pattern); black lace shoes, gray stockings, high turned down collar, necktie (usually a rather small knot); overcoat rarely buttoned.

Please detain and all expenses will be refunded.

Address all information,

COL. J. N. PARTRIDGE,
Commissioner and Chief of Police, New York.

ENTERTAINMENT AND RECEPTION OF BROOKLYN BRANCH.

The master plumbers of Brooklyn are to be congratulated on the very successful entertainment and reception given by them last Tuesday evening. Although the elements were against the success of the affair, Schwaben Hall, at Knickerbocker and Myrtle avenues, Brooklyn, was crowded with the members, their families and friends. The entertainment, which consisted of ten numbers, was enthusiastically applauded. At the close of the performance Edward Macdonald, on behalf of the association, presented the retiring president, George W. Smyth, with a very handsome watch chain, together with a jeweled charm suitably engraved, and in a few well chosen words told him how the organization appreciated his untiring efforts for its good in the various offices which he has held. After the grand march dancing followed, and at a late hour the festivities were still going on.

The supply trade of Brooklyn was well represented by principals and salesmen, and many of the Manhattan houses also had representatives at the affair. Delegations were present from the Manhattan, Queens, Richmond and Bronx associations. The guests were well provided for by a very efficient Reception Committee headed by Harry Noble.

Treasurer A. H. Brown and Executive Committeeman B. F. Donohoe represented the State Association; President I. J. Brown and Secretary T. A. Hill represented the Greater New York Association, and John Anderson of Flushing, treasurer of Queens Branch; Fred. Rauscher of Port Richmond, S. I., and Jos. Corkery represented the Queens, Richmond and Bronx branches, respectively. Manhattan was well represented by a dozen or more of the "old guard," headed by ex-National President S. L. Malcolm.

Heating and Plumbing Notes.

B. D. HAMMELBAUGH, secretary of the Board of Control of the school district of Harrisburg, Pa., will receive bids until January 30 for heating and ventilating a 24-room school building, to be erected at Sixth and Woodbine streets, Harrisburg, Pa.

LEWIS BATES has taken a store on Washington street, Weymouth, Mass., where he will conduct a plumbing and steam heating business.

THE striking plumbers of Wichita, Kan., have agreed to go to work at the old rate of wages for 60 days, after which they demand $3.50 a day for senior plumbers and $2.50 for junior plumbers, eight hours to constitute a day's work.

THE NASON MFG. COMPANY, 71 Beekman street, New York, announce that on January 1 they ceased to do any construction work, and in future will devote their entire attention to pushing their extensive line of Steam Fitters' and Plumbers' Supplies. They also have in their Equator and Gulf Stream a well-known line of Steam and Hot Water Heaters. C. P. Vanderveer will visit the trade in the vicinity of New York in the interests of the house.

L. F. GRADY, New Haven, Conn., has the contract for plumbing and hot air heating in two houses that are being built in that city for Thomas Brennan.

THE plumbing of the club house of the Country Club

in Farmingtou, Conn., has just been fiuished by Thomas Oakes & Son of Hartford. The firm also have the contract for the plumbing and wiring of a house for A. D. Pierce, and will furnish gas fixtures for a house which J. E. Mooney is building in Windsor Locks.

The Sanitary Specialty Mfg. Company, 55 and 57 North Clinton street and 24 to 30 Milwaukee avenue, Chicago, have just issued two very neat catalogues. One of these catalogues is devoted to Bathtubs and the other to Plumbers' aud Steam Fitters' Tools. The Bathtub catalogue presents a large number of illustratious of Enameled Iron Tubs of all the desirable styles, including Seat and Foot Baths. The contents further treat of Tubs made wholly of Steel, Steel Shell, Copper Lined Tubs and Copper Tubs to be iuclosed in wood. In addition, a large line of Bathtub Fixtures is shown, as well as Bathtub aud Lavatory Trimmings and Supplies. The Tool catalogue presents a very great assortment of Tools required by plumbers and steam fitters, all the Tools being illustrated and full price-lists being printed in connection with each. These catalogues are each 48 pages in size, and are thus small and convenient for ready reference. They present a much greater variety of contents than would ordinarily be found in catalogues of this size.

E. G. Bates, Springfield, Mass., has the contract for plumbing the new factory which is being erected at the corner of Wilbraham avenue and King street, iu that city, for A. O. Kittredge.

H. T. Gates, formerly of the firm of James & Gates, a wholesale boiler house in New York City, has engaged with the Prizer-Paiuter Stove & Heater Company to look after the interests of the Henderson Thermo line of Steam aud Hot Water Heaters in New York City and vicinity. Mr. Gates has opened an office iu the Mohawk Building, Twenty-first street and Fifth avenue.

G. W. Minor of Waterbury, Conn., has just finished a job of plumbing and heating in M. W. Deuny's house, at Waterville. Mr. Minor is now located in his new quarters in the Pritchard Block, Waterbury.

Daniel Thurber is visiting the heating trade in the vicinity of New York City in the interest of the New York Central Iron Works and the Denning Steam and Hot Water Boilers.

J. J. Ryan & Co., brass founders and finishers, 68-74 West Monroe street, Chicago, report receiving contracts for the Brass Nickel Plate Trimmings for the marble closet and urinal stalls and lavatories for the following buildings: Pasavant Hospital, Mercy Hospital, Wesley Hospital, Rush Medical College, Manufacturers' Building, National Life Building, Chicago Commons, Chicago; Grand Opera House, Cincinnati; McLean County Court House, Bloomington, Ill.; Montana State Capitol, Helena, Mont.; U. S. Post Office, Streator, Ill.; U. S. Post Office, Monmouth, Ill.; U. S. Post Office, Elgin, Ill.; Draper Buildiug, Honolulu, H. I.

A fire visited the plumbing shop of Collins & Spencer, at Saratoga Springs, N. Y., last week, doing a slight damage, which was covered by insurance.

N. J. Lennertz and James C. Smith have been appointed members of the Examining and Supervising Board of Plumbers and Plumbing of Dunkirk, N. Y.

The Munro Plumbing Company of Whittendon, Mass., have moved into their new store at the corner of Bay and East Britannia streets.

Thomas E. Dunn has received from the Board of Plumbing Examiuers a certificate of competency to conduct a plumbing business at Cohoes, N. Y.

The Master Plumbers' Association of San Fraucisco, Cal., have moved their headquarters from the Alcazar Building, to Room No. 90 of the Donohoe Building, 1170 Market street, San Fransico.

Charles Morgan, formerly of Morgan & Ball, will have charge of the new supply department opened by the Stanley Company, at Pittsfield, Mass. This department is for the purpose of reaching small dealers in Arc Light Fixtures, Electric Fans, &c.

In order that his customers may thoroughly understand the operation of his patent Plumbers' Force Pump, John H. Lawless, 184-186 Third street, Jersey City, N. J., is distributing, in addition to an eight-page folder describing the Pump, a picture of the Pump 15 inches high, in the form of a broken and sectional view, so that the working parts can be readily seen. By means of this Pump a high pressure can be developed for opening a stoppage in service and waste pipes.

An open war is being waged at Spokane, Wash., between members of the Master Plumbers' Association and the plumbers who are not members. The local supply houses are refusing to furnish plumbing goods to the outside plumbers, who are arranging to secure their supplies from other cities.

The plumbing inspector of Holyoke, Mass., has refused to approve of the plumbing of the water closets in the new City Library Building, owing to the failure to equip them with local vents as required by law. As a result the Board of Health will not allow the building to be opened for use.

The Board of Education of Grand Rapids, Mich., have awarded to Weatherly & Pulte the contract for heating the Alexander Avenue School, in that city, at their bid of $1760.

At the annual meeting of the stockholders of the Stradling Plumbing & Heating Company, Utica, N. Y., the following were elected directors: E. W. Stradling, E. H. Bice, A. H. Dobsou, John J. Droz and E. J. Stradling. A. H. Dobson and John J. Droz were chosen inspectors of election. At the meeting of the directors officers were elected as follows: President, E. W. Stradling; vice-president, E. H. Bice; secretary, E. J. Stradling; treasurer, A. H. Dobson.

A plumber's furnace, getting too close to the wood work, caused a $400 fire in the plumbing shop of Luther R. Gilson, 115 Washingtou street Boston, Mass., last week.

A meeting of the dealers in plumbers' and manufacturers' supplies was held on January 16, at The Boody, Toledo, Ohio, when trade matters were discussed. Representatives of Detroit, Toledo aud Cleveland concerns were present.

J. F. Kidder of Winooski, Vt., has removed his plumbing establishment to Burliugton, Vt., and will occupy the shop formerly used by Z. T. Austin on Main street.

New Firms and Changes.

L. H. Snyder & Co. are a new firm at Bristol, Conn., who will manufacture Floor aud Ceiling Plates for steam pipes, Plumbers' Supplies and small novelties. Mr. Snyder was formerly superinteudent for the Coddling Mfg. Company.

Howard Gould will opeu a plumbing shop iu Highland, Mass., about February 1.

Joseph McCreery succeeds the heatiug and veutilating firm of Joseph McCreery & Son, at 647 Iufirmary Road, Toledo, Ohio.

The firm of H. Sandmeyer & Co. and the Peoria Heating Compauy of Peoria, Ill., have been cousolidated iu a new incorporated company having a capital stock of $100,000. Among those interested in the new company are: H. Sandmeyer, Sr.; H. Sandmeyer, Jr.; W. D. Dickson and W. D. Shafer. The new company will reward H. W. Kroos, one of their employees, who has been with them for 25 years, by taking him into the firm.

Freeman Thomas, Troy, N. Y., has bought the general plumbing business conducted for years by his father, John L. Thomas.

The American Warming & Ventilating Company of Elmira, N. Y., have been incorporated with a capital stock of $10,000 by L. B. Shoemaker, R. M. Geddes and George McCann.

John Reilly, formerly with Hurley & Reilly, has opened a plumbiug shop at 244 Crescent avenue, Bridgeport, Coun.

The Warnock Mfg. Company of Portland, Maine, have been incorporated under New Jersey laws with an authorized capital of $25,000 to manufacture Plumbing and Hardware Supplies. The president of the concern

is Llewellyn Carlton of Portland and the treasurer Ernest O. Hiler of Boston, Mass.

Pontier & Roosma, plumbers, of Passaic, N. J., have dissolved partnership. The business will be continued by Jacob Pontier, Mr. Roosma having retired.

Application has been made for a charter for the Reading Gas & Electric Fixture Company of Reading, Pa., to be capitalized with $25,000. Herman Schussler of Bridgeton, N. J., who is the head of the new company, is the owner of patents on a number of improvements in Gas and Electric Fixtures, &c., which the firm will make a specialty of manufacturing. A large plant is being fitted up in Reading, and the company already have a number of good orders on their books.

Hardware Organizations.

Missouri Retail Stove and Hardware Dealers' Association.

The annual meeting of the Missouri Retail Stove and Hardware Dealers' Association will be held in St. Louis February 18 and 19. The Lindell Hotel has been selected as the convention headquarters, while the business meetings will be held in the Mercantile Club rooms, at the corner of Seventh and Locust streets. A fare of one and one-third for the round trip has been granted by the railroads, but in order to secure this rate the delegates and others attending the convention must obtain receipt from ticket agent at point where ticket is purchased. The St. Louis Committee on Arrangements is composed of F. A. Kansteiner, August Steinmeier and G. A. Pauley. The convention is expected to be the largest ever held by the association.

The meeting will be called to order at 10 o'clock on the morning of the 18th, when the president will make his annual address. This will be followed by the secretary's report, and the session will be brought to a close by a paper by Taylor Frier of Louisiana, Mo., who will have for his subject, "Association Loyalty." The afternoon session will open at 2 o'clock, the first number on the programme being an address by M. L. Corey of Argos, Ind., secretary of the National Retail Hardware Dealers' Association. Mr. Corey will be followed by H. F. Wright, Lebanon, Mo., who will read a paper entitled "Are Retailers Adjusting Their Methods to Twentieth Century Conditions?" and by Aug. Steinmeier, St. Louis, who will discuss the topic, "Is Co-operative Buying Practical?" Attention will then be given to the contents of the Question Box. The morning session of the second day will be inaugurated with a paper by Louis Hering of Blackburn, who will discuss "Store Character, or the Value of a Business Reputation." He will be followed by R. W. Shapleigh of the Norvell-Shapleigh Hardware Company of St. Louis, who will make an address. The features of the closing session in the afternoon will be a general discussion of the subject of "Co-operative Insurance," and a paper by William Kansteiner of Hannibal on "The Evolution of the Hardware Business, 1850-1901." Frederick Neudorff, St. Joseph, is the secretary of the association.

Michigan Retail Hardware Dealers' Association.

A meeting of the Executive Committee of the Michigan Retail Hardware Dealers' Association was held at the Hotel Cadillac, Detroit, on the 13th inst. The following members were present: President H. C. Minnie, Messrs. Potter of Alpena, Popp of Saginaw, Pipp of Otsego, Scott of Marine City, Harsha of Delray, and Treasurer H. C. Weber and the secretary. After an informal discussion as to the place of holding the next meeting it was unanimously decided to hold it in Detroit, August 13 and 14, at the Hotel Cadillac.

Various plans for increasing the membership were discussed and it was finally, on motion of Mr. Weber, decided to make a general offer of $1 cash for each new member obtained, the following special prizes being offered for those obtaining the largest list:

First.—A prize of $25, open to all who turn in 12 or more members, to be awarded to the one securing the highest number. Contestants for the $25 prize are barred from participating in either the $15 or $10 prizes.

Second.—A prize of $15, open to all who secure eight or more new members, to be awarded to the one securing the highest number. Contestants for the $15 prize are not allowed to participate in the $10 prize.

Third.—A prize of $10, open to all who secure five or more new members, to be awarded to the one securing the highest number.

On motion the president was instructed to appoint a committee who should have charge of the programme for the August convention and who should act in conjunction with the president and the assistant secretary. President Minnie appointed Messrs. Weber, Popp and Scott as members of that committee.

On motion the secretary was instructed to send to all members a list of the proceedings of this meeting, with that section of the by-laws relating to membership, in which he was to call especial attention to the prizes and awards for securing new members. He was also instructed to send a letter to the various hardware traveling men in Michigan calling their attention to these awards and urging them to co-operate in securing new members.

Secretary Fred. H. Cozzens, being now engaged in the wholesale hardware business in New York, stated that he could not equitably longer maintain his relations with the organization, and he therefore tendered his resignation, to take immediate effect, which was accepted after a resolution of thanks and appreciation had been unanimously passed. A further resolution, voting the sum of $100 in further recognition of his services in behalf of the retail Hardware trade, was also unanimously passed.

A resolution was also unanimously passed stating that it was the sense that the sales of builders' hardware to the consumer by the jobbers of Michigan were becoming altogether too frequent, and expressing it as the unanimous sense of the meeting that wherever such sales are made by jobber a proper commission on credit shall be given a retail dealer who does business within the normal selling district where the sale takes place. The secretary was requested to send a copy of these resolutions to all jobbers in Michigan and to request their co-operation in having it enforced.

H. C. Weber was elected secretary to fill the unexpired term of Mr. Cozzens, with authority to appoint an assistant secretary, which he at once did, appointing Clarence A. Day, assistant treasurer of the Trade Journal Association, in such capacity.

Iowa Retail Hardware Dealers' Association.

The fourth annual meeting of the Iowa Retail Hardware Dealers' Association will be held at Des Moines on February 18, 19 and 20, headquarters being at the Savery Hotel. An interesting programme has been prepared and every effort will be made by those in official charge to make the three days' gathering one of profit and pleasure. A number of papers are down on the programme, among them the following: "Benefits of Organization," by ex-President H. A. Cole, Council Bluffs, and C. R. Keating, Mt. Ayr; "Credits," by S. R. Miles, Mason City; "The Relation of Jobber and Retail Dealer," by C. F. Schmidt, Marshalltown; "Trusts in Their Relation to the Retail Dealer," by Geo. Staehle, Earlville, and "Our Competitors," by L. Lindenburg, Dubuque. There will be a Question Box as usual for the purpose of bringing up hardware matters on which the views of those in attendance are solicited. The secretary of this association is W. H. Keating, Ottumwa, who will cheerfully furnish any information desired in regard to the coming meeting.

Scheeler's Sons of Buffalo, N. Y., proprietors of the Buffalo Wire Works, have found it necessary to add to their large establishment a galvanizing and tinning plant to galvanize their product of Wire Cloth. The new plant, known as the Buffalo Galvanizing & Tinning Works, Scheeler's Sons & Charles J. Vogt, proprietors, Buffalo, is in a position to do work for the general trade.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

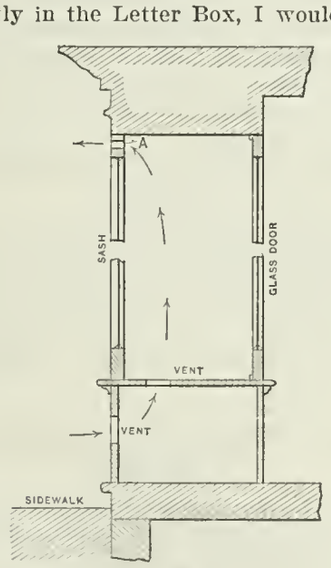
Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

ESTIMATING ON JOBS.

From W. H. D., Schenectady, N. Y.—Is it the practice of any good firms in estimating on plumbing and heating jobs to figure the goods at cost, and then add a regular percentage to determine the cost of labor? For instance, if the materials on a job cost $200, to get the cost of the labor multiply this by 25 per cent., which gives $50 for labor. Adding this to the cost of materials the total cost of the work would be $250.

Do you know of any other way of estimating besides figuring time on each of the fixtures required on the job? I have heard of firms successfully estimating on the percentage system.

Answer.—This question was submitted to a prominent New Jersey house, who make the following answer:



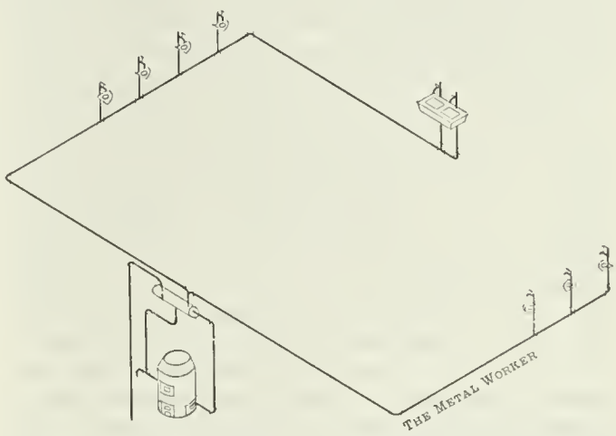
We have heard of people estimating cost of material, and where the labor was an uncertain quantity they would allow an equal amount for labor, to which a further allowance would be added for profit. For instance, in the example quoted: Cost of material, $200; labor, $200; total cost, $400, to which add the profit. We would not advise any one to pursue this course except where it is almost impossible to arrive at a fair idea of the labor. If the party estimating has no data to refer to or has not a good idea of how long it should take to do a piece of work, he had better not make any large contracts until he has had the experience.

Our method is to ascertain the time required for each class of work and to use such information as a basis in estimating. For example: Time required to fit up a sink complete, or a boiler, or water closet, or other fixtures, number of feet of cast iron pipe laid and calked complete in a day. Number of square feet of roofing in a day, &c. We have just completed some work where ratio was $4 of labor to $1 of material. We have another contract which we have estimated as $14 of material to $1 of labor. It is essential to have ability and experience behind the estimate in order to win in business.

Note.—The editor of *The Metal Worker* would be pleased to receive information regarding the methods used by its readers in different parts of the country with view to informing the trade as to the best practices in this important branch of the business.

FROST ON WINDOWS.

From F. T. D., San Francisco, Cal.—Referring to the correspondence about frost on show windows which appeared recently in the Letter Box, I would like to offer



Frost on Windows.

a plan which has been tried and found a success. The sketch which I send represents a vertical section through the show window indicating the method of ventilation. In order to accomplish the purpose an 8 x 10 inch iron ventilator was inserted under the show window facing the street and a ventilator of the same size was placed in the floor of the show window. The arrows indicate the direction of the currents, the fresh air entering at the bottom and the hot air escaping at the top through holes made in the sash. These holes, indicated by the letter A, were 1 inch in diameter and were placed every 6 inches across the top of the window. The ventilators might be made with closing shutters, so as to regulate the draft. The store in question is occupied by a dealer in Japanese fancy goods and the window has four gas lights.

WANTS HOT WATER SERVICE SYSTEM.

From R. T., Newark, N. J.—I have read the letter of "E. M. C." in *The Metal Worker* of January 4, and think that his problem is a comparatively simple one. I suppose that hot water will be drawn from this system for

Wants Hot Water Service System.

a comparatively short time during the day, and not, as in a residence, more or less continuously. On this account a small heating coil in the furnace and a large boiler would be best adapted for the purpose. If the heating coil was made large it would probably overheat the water and induce the generation of steam, causing a rumbling noise in the boiler; while if a larger boiler and small coil were used it would provide for the storage of plenty of hot water to be used when needed. A small heating coil in the furnace, under the conditions assumed, would have plenty of time to heat all the water needed, as hot as would be required. For that reason I recommend at least a 40-gallon boiler, and preferably one having 50 gallons capacity or more, with a water heating pipe 1 inch in diameter, only long enough to run directly across the fire pot at the top. This would not interfere with adding fuel or clearing the fire, and would expose enough surface to furnish all the hot water, if the conditions are as I assume. Owing to the large number of fixtures and their location being in an opera house all are likely to be used at the same time. It would be better, therefore, if the main hot water service pipe was ⅝ or ¾ inch in size, and the branches for supplying the different fixtures were ⅜ inch. If the same size of pipe was used throughout, the fixtures at the end of the service line would in all probability be supplied with a very sluggish flow of water.

MEANING OF THE TERM "SPELTER."

From A. R. Y., Trenton, N. J.—I should like to know the difference between the terms "spelter" and "zinc," which seem to be applied indifferently to the same metal, and shall be glad if you can give me this information through the Letter Box.

Answer.—Spelter is the commercial name of zinc. It is a modification of the German word *spialter*, which formerly denoted the alloy of pewter composed of lead and tin with a slight admixture of antimony, copper and bismuth. Zinc was first produced commercially in Germany, and when put on the market about 200 years ago went under the old German name. The name zinc is a variation of *zinn*, which is the German word for tin.

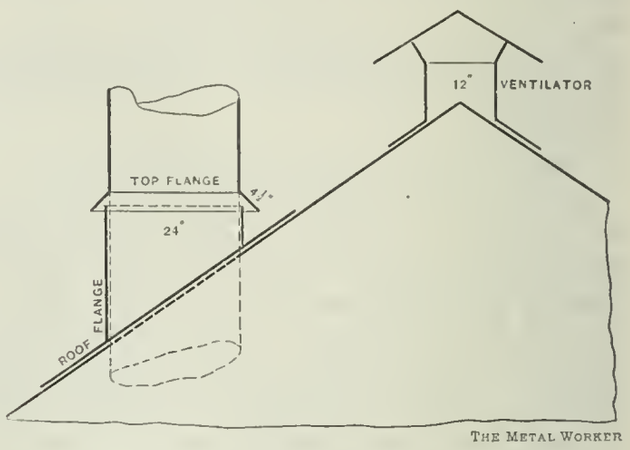
POOR DRAFT IN A STONE CHIMNEY.

From H. & W., Orange, N. J.—In *The Metal Worker* of January 18 "F. H. W." wants to know how to cure a poor draft in a stone chimney. The sketch shows an air tight cellar, and, if this is so, he should make an opening through which the air can enter the cellar. He can prove this by opening the cellar door and keeping it open for two or three hours while trying to make the fire burn. If there is no cellar door he should make a hole through the foundation walls, for air must go into the cellar if it is to enter the fire and pass up the chimney and come out. If this is done without success he should break into the chimney at or near the floor and build a fire of kindling wood until the chimney is warmed up clear to the top. The case is a hard one if success does not attend experiment along these lines. A stone chimney on the outside of a house is cold and damp; besides it is apt to be rough on the inside, all of which tends against a perfect draft. The ideal chimney is located on the inside of a house, is built of brick and lined with chimney tile, straight and smooth, warm and dry, with all joints tight, and it is bound to work unless interfered with by trees and conditions on the outside.

When "F. H. W." has tried the suggestions given and those received from other readers, let him be grateful and tell of his success to the readers of *The Metal Worker*. Trying to help a man and never knowing whether the assistance given leads to success is very unsatisfactory to those who give it. There is a special difficulty in the use of cast iron pipe in a chimney. After it has been in use a little while it will clog up with rust and soot, and it is impossible to keep it clear. The flakes of iron dislodged by the smoke acids will choke up the cast iron pipe, under some conditions, in three or four months. The obstruction can be removed by an iron pole attached to a chain and rope. We have had such experience with a better chimney than that described by "F. H. W."

From F. K., Chicago.—In reply to the inquiry of "F. H. W.," in *The Metal Worker* of January 18, relative to a poor draft in a stone chimney, I would say that I had a job of this kind and made the chimney dry by the following experiment: I found that there was not enough fresh air in the cellar to produce perfect combustion and therefore made a pipe leading from the ash pit through to the outside of the building, thereby supplying the fire with fresh air. This experiment was a perfect success. "F. H. W.'s" trouble may arise from the same cause. All I ask of him is that he will let me and the other readers of *The Metal Worker* know how he succeeds.

From J. W., Brooklyn.—I notice the letter of "F. H. W." in *The Metal Worker* of January 18 and would suggest that if he connects a 6-inch pipe to the ash pit of the boiler and extends it to the outside of the building on the side of the prevailing winds, and sees that the outlet on the top of the chimney is no larger than a 9-inch smoke pipe, he will secure a proper draft, provided he keeps the ash pit and feed doors closed.



CONSTRUCTION OF WATER HEATER.

From M., Sheldon, Vt.—Would it be advisable to provide a tank in the upper part of a house for carrying a supply of water to protect a pipe water heater placed in a range and connected with a range boiler? The fixtures are now supplied with water from a reservoir, and in case this supply should be stopped from any cause the coil in the range might be destroyed from heat, so as to be of no further use, even if no other damage was done.

Answer.—The protection suggested is not adopted in connection with many plumbing systems where the supply might be shut off temporarily. In case the supply were shut off the range boiler would be filled with water which would circulate through the pipe coil and prevent its destruction. If the stove was run hard steam might be generated or the vapor from the hot water might escape from the faucets and eventually empty the boiler, when the destruction suggested might occur. If there is a strong probability of the supply being shut off for a considerable time there can be no doubt as to the advisability of providing the supply tank. This tank might be supplied from the regular water service main, carrying the pipe up and bending the end over the top of the tank, so as to discharge into it. This tank should be connected with the regular supply pipes to the different fixtures, so that the water could be occasionally drawn off to prevent stagnation when the regular supply is available.

COST OF FLANGES AND VENTILATOR.

From R. & B., Medaryville, Ind.—We should like to ask the readers of *The Metal Worker* to tell us their methods of arriving at the prices to be charged for making out of No. 24 galvanized iron a 24-inch roof flange to go

Cost of Flanges and Ventilator.

around a 24-inch smokestack, and also of the small flange riveted on the smokestack just above the roof flange to keep the rain from going between the roof flange and the smokestack.

Kindly also tell method for finding price to be charged for a 12-inch ventilator. The flange and the ventilator are both to go on a roof of one-third pitch.

SUGGESTIONS FOR IMPROVING "THE METAL WORKER."

From H. & W., Orange, N. J.—We would suggest that at the head of the Letter Box column you put the following: "It is especially desired and considered as a part of the agreement that any one asking for information to solve the puzzling problems which arise in transacting business and doing work shall, upon successfully solving the problem through the aid given in the Letter Box, in return for the assistance received, write an account of the method of securing success for the benefit of others who may need assistance and for the satisfaction of those who have given the aid sought."

ILLUMINATING GAS FROM A COAL STOVE?

From M. C. R., Dayton, Ohio.—I have heard that there is a coal heating stove which is made to furnish gas for illuminating the room in which it is placed. Can you give me any idea as to who manufactures such a stove? I should be very thankful for any information the readers of *The Metal Worker* can furnish on this point.

MATERIAL FOR MARKING GALVANIZED IRON.

From J. H. F., Burlington, Iowa.—We should be glad of any information as to the best materials and process for marking galvanized iron which must be exposed to the weather. We have used various paints and varnishes in stenciling goods that we manufacture, but want to know if there is any material that we can use for this purpose that would be more expeditious and equally weather proof. Can rubber stamps be used in applying any material that would be weather proof?

TRADE REPORT.

MARKET SUMMARY.

Pig Tin, after fluctuations, remains at last week's price level.

Copper is dull and a shade lower.

Pig Lead is dull and unchanged.

Spelter continues dull and without change in price.

Antimony is unchanged.

Nickel remains at former prices.

Aluminum is active and unchanged.

Tin Plates are moving in fair volume at former prices.

Sheets are still in heavy demand; jobbers' prices are rather lower.

Sheet Copper has been reduced 2c. per lb.

Scrap Metals are more active and firm.

Pig Iron is strong and active, with upward tendency.

Hardware is moving in increased volume, with prices well maintained.

Cast Iron Soil Pipe and Fittings are not advanced in price, but higher prices are looked for.

Wire Nails are stronger, with moderate demand.

Cut Nails are in fair demand at former prices.

Window Glass is dull, with future of prices uncertain.

White Lead is moving well; prices are unchanged.

Linseed Oil is firm and may go higher.

Spirits Turpentine was advanced 4c. per gallon.

METAL MARKET.

NEW YORK, January 24, 1902.

Pig Tin.—Under manipulating influences, the London Tin market advanced considerably in the early part of the week, and the rise there had a stimulating influence on this market, although the advance here was in no wise commensurate with the rise in London. A reaction took place later in the week both here and there, bringing prices down to about the level recorded in our last report. Jobbers quote Straits Pig in small lots at 24½c. to 25c. per lb. The volume of business is very light, and the market, as a while, is dull and tame, so far as transactions are concerned. Arrivals here during the last few days were very heavy, and to date this month aggregate 2590 tons.

Copper.—Prices of Copper have declined a shade further. It is said that a fair business in prompt delivery has been transacted at the lower figures. It is further reported that the large producers are following up inquiries very closely, and shading any quoted figure in order to capture orders. At the present time there are really no established market rates. Those officially quoted by the New York Metal Exchange merely indicate a basis toward which producers' transactions approximate. Business, in short, is being done on a hand to mouth basis, and is probably small in the aggregate. Lake Ingot in small lots is quoted by jobbers at about 11¾c. to 12c. per lb., and Casting Copper at 11¼c. to 11½c.

Sheet Copper.—In another column details are given regarding the reduction in the price of Sheet Copper, which was announced by the manufacturers on Thursday. This is the second reduction since the beginning of the year, and it brings the price of the material down 5c. below the figures which ruled for some time before the first reduction, made on January 2. While it is too early as yet to note any increase in the demand for Sheet Copper, it is regarded in the trade as certain that this latest action of the manufacturers will have the effect of greatly stimulating the demand, which has been of very light proportions ever since the disturbance in the Copper market began. As reported for some weeks past, consumers have been buying strictly from hand to mouth, and stocks of Sheet Copper in their hands are known to be unusually light. The present base price of Sheet Copper is 16c. per lb.

Pig Lead.—The market for Pig Lead continues very dull and uninteresting. Prices are unchanged and firm and the volume of business shows no improvement. American Pig in small lots is quoted by jobbers at 4.40c. to 4½c. per lb. St. Louis advices indicate a quieter tendency in the Pig Lead situation in that market, and a smaller volume of business is said to have been transacted in the past week at former figures.

Spelter.—The market is very dull and prices are a shade lower. The demand is referred to as exceedingly light. Good Western brands in small lots are quoted by jobbers at 4⅝c. to 4¾c. per lb. It is generally conceded that the latest attempt to consolidate has proved a failure. The options have expired and nothing further is being done in the matter at present. St. Louis advices report a lighter run of transactions in Spelter in that market, with no change in prices.

Sheet Zinc.—The conditions in this metal are without change. Jobbers quote 600-lb. cask lots at 6¾c. and small quantities at 7¼c. per lb.

Antimony.—There is no change in this metal. Hallett's and U. S. in small lots are quoted at 8¼c. to 8¾c. per lb., and Cookson's at 10¼c. to 10¾c.

Nickel.—The market is unchanged, small lots being quoted on a basis of 60c. to 65c. per lb.

Aluminum.—The market for Aluminum keeps up in good volume. Prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37. per lb., and 100-lb. lots at 35c.

Tin Plates.—Conditions in this market remain without any change worthy of note. The large buyers are reported to be covering their wants for the first half of the year. The American Tin Plate Company announce that they are unable to take any orders whatever for January delivery. The demand from smaller consumers is referred to as very satisfactory for the season, and jobbers' prices are pretty firmly held, there being no surplus stocks of any kind of Plates. American Bessemer Coke Plates, IC, 14 x 20, in small lots, delivered at New York and corresponding points rule at about $4.90 to $5.15 per box.

Sheets.—A fairly large volume of new business in both Black and Galvanized Sheets is reported and the market is strong. Notwithstanding the increased capacity provided by the starting up of new mills the manufacturers of Sheets are still unable to keep pace fairly with the demand. The mills have been hampered in many instances by the difficulty of getting sufficient fuel and raw material, owing to the lack of transportation facilities, and some of them are badly handicapped on this account, which tends to make them still more backward in their deliveries. The retail trade in both Black and Galvanized Sheets in New York City is referred to as keeping up in good volume, but stocks are not quite so restricted as they were a few weeks ago. Consequently jobbers' prices have eased off to some extent. Small lots of No. 27 One Pass Cold Rolled Soft Steel Black Sheets are quoted at about 3.95c. to 4c., and Galvanized Sheets at 67½ and 5 to 70 per cent. off the list.

Chicago advices are as follows: The independent mills are feeling the usual midwinter slackness in the demand for standard sizes. The mills making a full range of sizes and qualities are picking up considerable business, however, so that trade cannot be called dull. It is, in fact, remarkably good for this time of the year. Jobbers have slightly reduced the store price and small lots of No. 27 Black Sheets are quoted at 3.35c. to 3.45c., and Galvanized at 70 and 2½ to 70 and 5.

Old Metals.—The demand for Scrap Iron is very active and prices are firm. Old Brass and Copper are also more active, with prices a little firmer, if anything.

Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	9½c.
Light and Tinned Copper	per lb.	7¾c.
Heavy Brass	per lb.	7¼c.
Light Brass	per lb.	5¾c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3½c.
Zinc	per lb.	3 c.
No. 1 Pewter	per lb.	15¾c.
No. 2 Pewter	per lb.	8 c.
Tin Plate Scrap, per gross ton		$5.00
Wrought Iron Scrap, per gross ton	$11.00 to	11.50
Heavy Cast Scrap, per gross ton	10.50 to	11.00
Stove Plate Scrap, per gross	8.00 to	8.25
Burnt Iron, per gross ton	5.50 to	5.75

THE PIG IRON MARKET.

New York.—There has been a moderate amount of buying in this district, and the market continues firm. We quote for Northern Irons: No. 1, $16.50 to $17.50; No. 2 X, $16 to $16.50; No. 2 Plain, $15.50 to $16; Tennessee and Alabama brands, No. 1 Foundry, $16.25 to $16.75; No. 2 Foundry, $15.75 to $16; No. 1 Soft, $16.25 to $16.75; No. 2 Soft, $15.75 to $16; No. 3 Foundry, $15.25 to $15.50; No. 4 Foundry, $14.75 to $15.

Chicago.—Large transactions are reported for delivery in the third quarter of the year, quite a number of contracts being placed for lots of 3000 to 5000 tons by manufacturers of Radiators, Stoves and General Castings. Negotiations are in hand for further large quantities, showing that the buying movement has not yet ended. A sharp demand exists for spot lots of Iron, on which premiums are freely paid above prices ruling on contracts. The supply of Iron for quick shipment, however, is very small, and can now only be obtained from a few Southern or Lake Superior Charcoal furnaces. The situation has improved with respect to the Coke supply. The supply of Foundry Pig Iron, however, does not show any expansion. We quote as follows:

Lake Superior Charcoal	$19.50 to	$20.50
Local Coke Foundry, No. 1	16.50 to	17.00
Local Coke Foundry, No. 2	16.00 to	16.50
Local Coke Foundry, No. 3	15.50 to	16.00
Local Scotch, No. 1	16.50 to	17.00
Ohio Strong Softeners, No. 1	19.50 to	20.00
Southern Silvery, according to Silicon.	16.90 to	17.15
Southern Coke, No. 1	16.40 to	16.65
Southern Coke, No. 2	15.65 to	15.90
Southern Coke, No. 3	15.15 to	15.40
Southern Coke, No. 1 Soft	16.40 to	16.65
Southern Coke, No. 2 Soft	15.65 to	15.90

Philadelphia.—It is difficult to secure good brands of Iron at the prices ruling a week ago. Most sellers of No. 2 X Foundry Iron demand $17.25, but some sales are made at $17.50 and at a still higher figure, the outside rate being for deliveries during the first quarter of the year. The range of prices at present is probably about as follows for Philadelphia and nearby deliveries: No. 1 X Foundry, $18 to $18.50; No. 2 X Foundry, $17 to $17.75; No. 2 Plain, $16.50 to $16.75.

Pittsburgh.—Very little Iron is to be had for shipment this side of July, and very high prices can be obtained by furnaces that can spare any Iron for shipment within the next three or four months. No. 2 Foundry Iron for second quarter has sold at $16.50 to $16.75, Pittsburgh. No. 1 rules at $17 to $17.50, depending on delivery.

Cincinnati.—There has been little change in the Pig Iron situation during the week. It is recognized as a fact that all the Iron which can be safely counted on for delivery up to July is booked on contracts. There has been quite a considerable amount of selling for the last half of the year, but the disposition of buyers now is rather to go slow on purchasing for extended delivery. The amount of business done during the past week was rather small. Quotations are without change. If there was any Iron for immediate delivery it would, of course, demand a premium. The situation, on the whole, is strong and healthy, the only trouble being the car shortage, which, while somewhat easier, does not really show very much betterment. We quote f.o.b. Cincinnati:

Southern Coke, No. 1	.... to	$15.25
Southern Coke, No. 2	.... to	14.75
Southern Coke, No. 3	.... to	14.25
Southern Coke, No. 4	.... to	13.75
Southern Coke, No. 1 Soft	.... to	15.25
Southern Coke, No. 2 Soft	.... to	14.75
Southern Coke, Gray Forge	.... to	13.75
Southern Coke, Mottled	.... to	13.75
Ohio Silvery, No. 1	$16.25 to	16.75
Ohio Silvery, No. 2	15.75 to	16.25
Lake Superior Coke, No. 1	.... to	17.10
Lake Superior Coke, No. 2	.... to	16.60
Lake Superior Coke, No. 3	.... to	16.10

St. Louis.—The good inquiry and demand which have been ruling in this market for some time continue. Evidently, requirements are not on a large scale, and it looks as though the wants of the larger local concerns were provided for some time ahead. The furnaces are not in a position to comply with orders for quick delivery in any round lots. It is thought that prices will hold at present level for some time. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$15.75 to	$16.00
Southern, No. 2 Foundry	15.25 to	15.50
Southern, No. 3 Foundry	14.75 to	15.00
Southern, No. 4 Foundry	14.25 to	14.50
No. 1 Soft	15.75 to	16.00
No. 2 Soft	15.25 to	15.50

CHICAGO REPORT.

Scrap Iron and Steel.—Business is excellent, the demand easily absorbing the supply now coming in. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.	
Country Wrought Scrap	$11.00 to	$11.50
Machinery Cast	10.50 to	11.00
Malleable Cast	10.00 to	11.00
Stove Plate (free from burnt)	8.00 to	8.50
Burnt Iron and Grate Bars	5.50 to	6.00
Sheet Iron and Hoops	6.00 to	7.00
Plow Steel	.... to	7.00
Breaking Stock	9.00 to	10.00
No. 2, such as Shovels, Hoes, &c	.... to	7.00
Old Boilers—whole (Iron)	6.50 to	7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to	11.00
Old Gas Pipes and Boiler Tubes	10.50 to	11.00
Cast Borings	4.50 to	5.00
Turnings	9.50 to	10.00
Horseshoes	12.00 to	....

Old Metals.—At last consumers of Old Copper and Brass are attracted by the low prices and trade is heavy. The demand has slightly stiffened the market on these commodities. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	9½c.
Copper Bottoms	8¼c.
Copper Clips	9 c.
Red Brass	9 c.
Yellow Brass	7 c.
Red Brass Borings	8½c.
Yellow Brass Borings	6 c.
Light Brass	5¾c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2¾c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.

Old Rubber.—The movement is light and prices are weak. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6½c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6¾c.
Black Rubber	....	4¼c.
White Rubber	....	8 c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—The demand is very much better. Local stocks are in good shape, permitting prompt shipments to be made. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo.	8.25	8.50

The Crane & Ordway Company, St. Paul, Minn., have leased a large building in Duluth and will shortly open a wholesale house for the purpose of carrying a stock of Mining, Mill and Lumbermen's Supplies, Ship Chandlery, Steam Pumps, Hoists, Engineers' Supplies, Belting, Piping, &c. The company withdrew from the Duluth wholesale field some years since, but believe now that the time has arrived when the condition of trade in the territory tributary to Duluth warrants the re-establishment of this connection. The resident manager of the company will be Charles A. Payne. They will for the present cover Northwestern Wisconsin and Northern Minnesota with their traveling salesmen.

HARDWARE TRADE.

Since the middle of the month there has been an evident increase in the volume of business, and the machinery for the production and distribution of goods is now in full operation. In many lines manufacturers are kept busy on their customers' orders, without much opportunity to accumulate stock. They report the inquiries from the trade as indicating a large volume of business during the next few months. Travelers generally are out and the result of their activity is the sending in of orders which are referred to as very satisfactory in volume. The trade are disposed to purchase a little earlier than sometimes, in view of the tone of the market, the excellent condition of current business and the possibility that there may after a while be difficulty in obtaining prompt shipments. The changes in price for the week under review are few and for the most part comparatively unimportant. The stiffening in the Nail and Wire market is having an excellent effect on the trade in general. Manufacturers express some annoyance from delay in obtaining raw material, principally on account of the shortage of cars. The movement of heavy lines is also interfered with from the same cause. The matter of organization among the retail trade will be brought to the front during the coming month, when so many of the associations hold their annual meetings, and questions relating to the welfare of the trade are naturally attracting some attention at this time. The subject of consolidation of jobbing interests is occasionally broached, principally in an interrogatory way. While it is understood that the project is not abandoned and may possibly be awaiting consummation in some form very different from the comprehensive scheme that was originally proposed, it is impossible to obtain anything definite in regard to the plans or operations of its promoters. In the meanwhile there is some talk of consolidation among manufacturers in lines in which up to the present there has been little indication of harmony or a disposition to work together.

NOTES ON PRICES

Cast Iron Soil Pipe and Fittings.—A meeting of the manufacturers of Cast Iron Soil Pipe and Fittings, which was held at The Arena, New York City, on Wednesday, January 22, resulted in a reaffirming of the previous prices. It is said that while the leading interest in this industry, together with several of the independent manufacturers, were in favor of an advance in prices, a number of the Western manufacturers and one of the Eastern manufacturers exhibited such opposition to an advance at the present time that action upon prices was deferred to some future date. The consensus of opinion of all the manufacturers being that it would probably be advisable to make an advance before long, it is felt that the matter is merely postponed. The Western manufacturers were of the opinion that the entire business should be conducted on a basis similar to that now in vogue among the manufacturers of Kitchen Range Boilers—that is to say, that the Soil Pipe manufacturers should market their wares and sell goods to the jobbing trade on a rebate system. This the Eastern manufacturers were not prepared to accept. It is understood that a compromise of the matter was arrived at whereby Western manufacturers and Eastern manufacturers are to sell goods within a given territory on this basis. All the sales of Cast Iron Soil Pipe and Fittings will be conducted as heretofore in the Eastern sections of the country. This, we understand, is due to the fact that the Eastern jobbers are not in favor of the rebate scheme. A committee was appointed which will report in the early part of February on the new schedule of discounts, which will equalize the selling prices all over the entire country. In the meantime it is understood among the manufacturers that they are to restrict their taking of orders to certain limits. No blanket orders are to be taken. All orders are to be accepted for immediate shipment, and no orders are to be accepted unless accompanied by specifications. Little doubt is felt in the trade that an advance in Cast Iron Pipe and Fittings will take place within a short time.

Plumbers' Brass Work.—The new prices issued by the Manufacturers' Association of Plumbers' Brass Work at the meeting which was held in Pittsburgh on the 14th inst. do not show such a radical decline as was expected. The prices follow the changes suggested by the secretary of the association, William T. Doyle, in his letter to the manufacturers, which was issued under date of January 2. In that letter Mr. Doyle showed that 1 cent per pound advance in the price of Copper made a difference of but 1½ per cent. in the cost of the finished product, and that a reduction of 4 cents per pound in the price of Copper made a reduction of but 2 8-10 per cent. per pound in the price of the finished product, which gave, as a result, an average decrease of 6 per cent. in the price which had been previously in effect. The actual average decline is very close to 7½ per cent. Finished Ground Key Bibs and Stops, Rough T. & L. Handle Stops, Shower Stops, Flange and Handle, Compression Work, such as Bibs for Lead and Iron Pipe, Urinal Cocks, Sill Cocks, Stops and Stops and Wastes, Ball Cocks, Basin Cocks, all underwent a decline of 10 per cent. Rough Ground Key Bibs, Round Way Stops, "H" Pattern Round Way Stops, Hydrant Cocks, Corporation Cocks, Plain Bibs, Flanged for Iron Pipe and Flange and Thimble Compression Competition Bibs, Compression Low Down Basin Cocks, Compression Double Bath Cocks, and the entire line of Fuller work underwent a change of but 5 per cent. Self closing work of all styles did not undergo any change whatever. The general Brass Goods market is dull. There is not a very strong demand for them at the present time, and the jobbing trade are holding off, thinking that the market has not yet reached bottom. The manufacturers feel confident that the Copper market will react within a short time, and they do not want to have to fight their way back to profitable prices. They claim that the market for Brass work has been so cut up in recent years that no one has made money, and this claim seems to be well founded, inasmuch as one of the largest New England manufacturers is now in the receiver's hands, one large Western manufacturing concern is now entirely out of business, and two of the Western manufacturers had to consolidate in order to keep their heads above water.

Sheet Copper.—Under date of January 23 the manufacturers of Sheet Copper announced a further reduction in price, amounting to 2 cents per pound. This reduction has been expected by the trade in consequence of the continued decline on Raw Copper. The present base price of Sheet Copper is 16 cents per pound; Cold Rolled Sheets, 17 cents; Cold Rolled Polished Sheets, 18 cents; Planished Sheets, 19 cents, and Bottoms, Pits and Flats, 20 cents per pound. It is the general impression that this latest reduction brings the price of Sheet Copper to as low a figure as it is likely to touch for some time and a considerable increase in the demand for this material is looked for, as consumers for some time past have been hesitating to buy anything beyond the limits of their actual current needs, in anticipation of the lower prices that have now been developed.

Wire Nails.—Since the meeting last week of outside manufacturers of Wire Nails the market has shown considerable strength. It is stated that the leading interests are refusing to go below the minimum price decided upon. While an immense business was booked for future delivery at prices recently current, many who were waiting for further declines in prices did not order before the advance. During this waiting policy, on the part of some, stocks in the hands of merchants throughout the country have been steadily reduced, and they are now thought to be quite light. The local demand for Wire Nails in the New York market is light. Small lots from store are quoted at $2.25 to $2.30 per keg.

Cut Nails.—For the season, the demand for Cut Nails is considered satisfactory. Representatives of mills are adhering to the price of $2.25 for Nails from store, and jobbers in the New York market are asking the same

price generally, although in some cases they are selling 2 cents below these figures.

Window Glass.—No understanding has been reached between the various interests in the Window Glass market. A meeting of the American Company and the Federation Association with the Jobbers' Association was to be held at the end of this week, when the future policy will probably be disclosed. This will be either to uphold the Glass market or encourage a rate war. There is very little local demand for Glass, as buyers are all waiting until some definite action has taken place.

White Lead.—A considerable quantity of White Lead in Oil is reported as being distributed by manufacturers, and the impression prevails that the demand will be large this year. Reports of concessions of ¼ cent per pound or more, according to brands, are persistently circulated. White Lead in Oil, in lots of less than 500 pounds, is quoted at 6½ to 6¾ cents per pound.

Linseed Oil.—Crushers are trying to force up prices of Oil, and it is possible that the price may be advanced materially in or before February. It is said that the Seed market is being manipulated for the purpose of advancing Oil. The buying is restricted to present necessities, the market being firm at about previous quotations. City Raw, in small lots, is quoted at 62 to 63 cents per gallon.

Spirits Turpentine.—During the week Turpentine has advanced 3 cents from the quotations given in our last report. This has checked buying to some extent. The local market holds firm on reports of a strong Southern market. Turpentine in small lots is quoted at 44 to 44½ cents per gallon.

TRADE NOTES.

THE EVANS STAMPING & PLATING COMPANY of Taunton, Mass., have been incorporated with a capital of $30,000. Edwin H. Evans is the president and Charles E. Evans treasurer of the concern.

POLISHERS' AND PLATERS' SUPPLIES, in the shape of Chemicals and Compounds, form the subject matter of a neat circular that is being sent out by the Harshaw, Fuller & Goodwin Company of 100 William street, New York, and the Electric Building, Cleveland, Ohio. A special leaflet calls the attention of the trade to the company's Nickel Anodes and Nickel Salts.

DEMINICO & GOETTLER have purchased the North American Aluminum Works, at 176 Centre street, New York, and will manufacture Aluminum Novelties.

THE INTERNATIONAL ACHESON GRAPHITE COMPANY, Niagara Falls, N. Y., are sending out an artistic publication of 20 pages in the interests of their Acheson Graphite Electrodes, for use in electrolytic and electro metallurgical processes.

SCHULMAN & GARBER, who have been established in Minneapolis since 1884 as dealers in Scrap Iron and Metals, have removed from 1328 Washington avenue, North, to 329 Tenth avenue, South, where they have larger quarters.

THE AKRON MFG. COMPANY, Akron, Ohio, have received a contract from the Carrara Paint Company, Barberton, Ohio, for 800,000 Tin Pails per year for five years. The contract will necessitate the addition of new machinery and a larger force.

F. E. MYERS & BRO., Ashland, Ohio, manufacturers of the Myers Pumps and Hay Tools, have just completed the erection of a large raw material storehouse. It is a three-story brick building, 50 x 160 feet, of modern architecture. They are also increasing the capacity of their power plant by placing in it a 400 horse-power automatic high speed engine, a battery of Wilcox & Babcock boilers, two extra large dynamos and additional motors. These additions will make their power, light and storage capacity nearly one-third greater than heretofore.

WE are indebted to Lyon, Conklin & Co., Baltimore, Md., for one of the handsome desk blotters they are distributing to the trade. Beside the "pen" picture on the celluloid cover, the company take the occasion to announce to the trade their various brands of guaranteed Roofing Tin.

THE plant of the Hopson-Haftencamp Company, manufacturers of Roofing and Supplies, Grand Rapids, Mich., was destroyed by fire on January 21 with a loss of $25,000 on the building and $50,000 on stock and machinery. The damage is partly covered by insurance.

THE disappearance of the old established Tin Plate and Metal house of A. A. Thomson & Co., who have been established on Water street, New York City, for the past 40 or 50 years, leaves quite a gap in the local metal trade. The company went out of business on January 1.

WE have received with the compliments of E. L. Parker & Co., dealers in Tin Plate, Sheet Iron, Metals, Tinners' Supplies, &c., of 201-203 South Charles street, Baltimore, Md., a copy of the dainty calendar for 1902 which they are distributing to their friends. The calendar is arranged on four cards, each covering one quarter of the year, the decorations on each card being artistic representations of the pink and white clover blossoms. The calendar cards are provided with a silk ribbon for hanging. Accompanying the calendar is a folder calling attention to E. L. Parker & Co.'s special brands of high grade Roofing Plates.

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop.

An elementary manual for the young tinsmiths; A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 ⁘ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ⁘ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ⁘ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

NICKEL-STEEL-WARE

Patented Feb. 12, 1895.

COST	SELL

Analysis No. 72,339. NEW YORK, Dec. 7, 1896.
We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.
The enamel coating is homogeneous, of extra thickness, and great purity.
It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.
Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

LALANCE & GROSJEAN MFG. CO.:
GENTLEMEN—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.
We find this enamel is *absolutely pure and free from Arsenic, Antimony, Lead and other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,

In the Race.

Berger's Classik Ceilings are in the race, first, last and all the time.
They out-rank competing goods in essential particulars which give them the preference with high grade trade.
They are made in complete classified designs of celebrated artistic styles.
They are the most artistic metal ceilings made and have the greatest variety of patterns to choose from.
They set the pace in quality of stamping, and combine mechanical excellence with true decorative harmony.
If you are not handling

"BERGER'S Classik" TRADE MARK METAL CEILINGS

you are missing an opportunity it would pay you to grasp; other wide-awake dealers have grasped it to their profit.—**why not you?**
Let us give you full particulars. Write for our handsome Catalogue,—free upon application.

THE PENN METAL CEILING & ROOFING CO.,

PHILADELPHIA and BOSTON.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

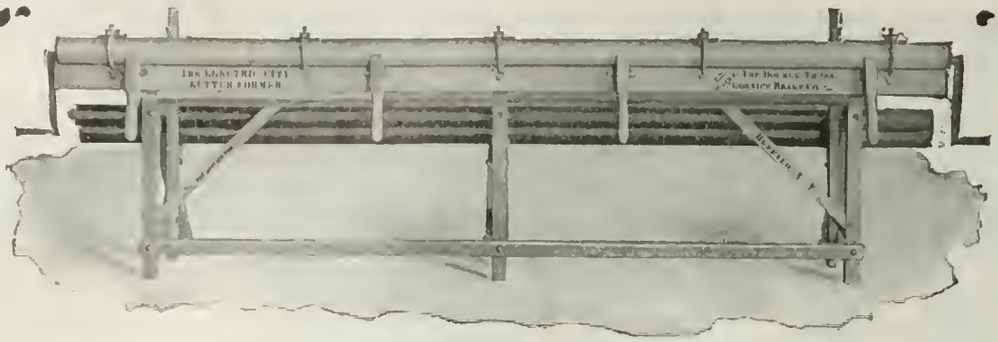
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burning or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ½ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

PRICE, - - $35.00.

The Roofing, Cornice and Skylight Manual describes how to lay flat and standing seam roofing, cornice shop practice, including cornice making, and the design and construction of skylights. $1.50 Postpaid.

DAVID WILLIAMS CO., 232-238 William St., N. Y.

Here's a man who examined a good many different ranges before he selected the Excelsior. He says: "The range we purchased gives entire satisfaction and we have no hesitation in recommending it. Its use with us has demonstrated that it has many advantages over any we have examined"

It is needless to say that the dealer who installed this range had no difficulty in collecting his bill.

ROUND OAK

STANDARD of AMERICA

Advertising is all right;
it is the life blood
of business, but
the best advertising
becomes palsied
unless backed up
by good goods.
It is perfectly useless
to put good ads
in the newspapers
and bad ranges
in the kitchens.
The range
and the ad
should work together.
If the range is a
Round Oak
it will corroborate
all the strong statements
you can put
in black type.
Why not stir up
the range business
in your territory
this spring?
Take up the
Round Oak
and go after it
hot foot.
It pays to advertise
and push the sale
of a good specialty.
Think it over.

"Go After It Hot Foot"

Estate of

P. D. BECKWITH

Dowagiac, Mich.

QUICK MEAL

Why **The "Quick Meal Evaporating Vapor Stoves" have been such a pronounced success?**

Because Their burner drums have always been made of the **heaviest** and **most durable materials known.** The **"Quick Meal"** has always used the only successful sub-burner, and has the most successfully arranged evaporating tubes for circulating and mixing the gas and air. They are simple, strong and durable. The assortment of the **"Quick Meal Evaporating" Stoves** is the largest on the market. Their styles are the latest and their finish the finest.

"Quick Meal" Steel Ranges are sold by enterprising dealers everywhere.

Reliable Vapor Stoves and Ranges for 1902.

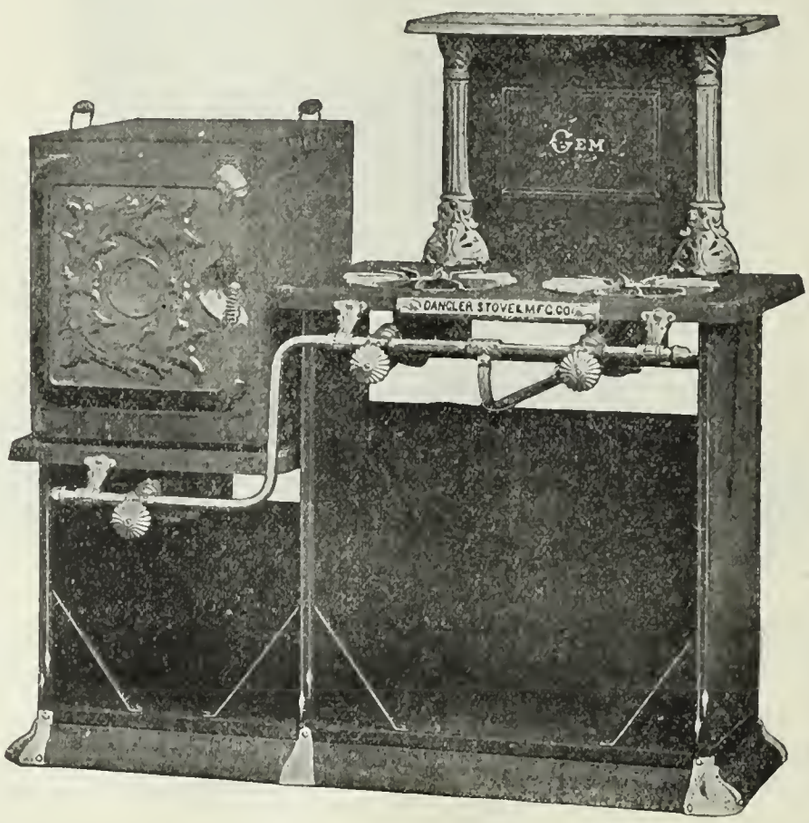
DEALERS who are seeking a strictly high grade line of Vapor Stoves and Ranges that are standard the country over cannot afford to overlook our line. "**RELIABLE**" Stoves have the NAME and FAME as being the best and most successful to handle.

THERE are NONE better. A few are claimed as good. None as well and favorably known. Our reputation will not permit of our making any inferior goods. If you wish to control the Vapor Stove business of your city, secure the agency of the "**RELIABLE.**" They have proved profitable and satisfactory to thousands in the past, and will to you.

Our line for 1902 is larger and finer than ever. Send for our latest catalogue. It is yours for the asking.

MADE BY

The Schneider & Trenkamp Company,



CLEVELAND. CHICAGO. SAN FRANCISCO.

THE DANGLER

For 1902 will put on the market a line of

Gasoline Vapor and Evaporating Stoves, Blue Flame Wick and Wickless Oil Stoves and also a line of Gas Ranges, Stoves, Hot Plates, etc. . . . . .

That for design, style and mechanical construction will not be equalled by any other make.

Our experience of 21 years in the manufacture of this line of goods,—being the oldest manufacturers,—justifies us in making the claim that our product has merits not found in other makes of Stoves in this line, notwithstanding that our lists, discounts and terms are the same as other manufacturers'.

All orders intrusted to us will have our careful and prompt attention. For further information we invite correspondence.

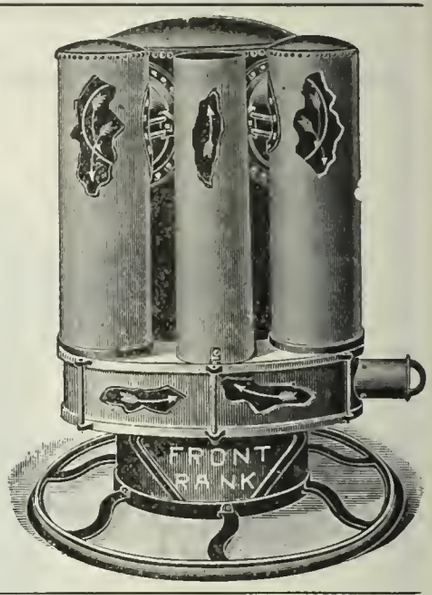
Enterprise Stove Co., VINCENNES, IND.

Front Rank Hot Air Furnaces

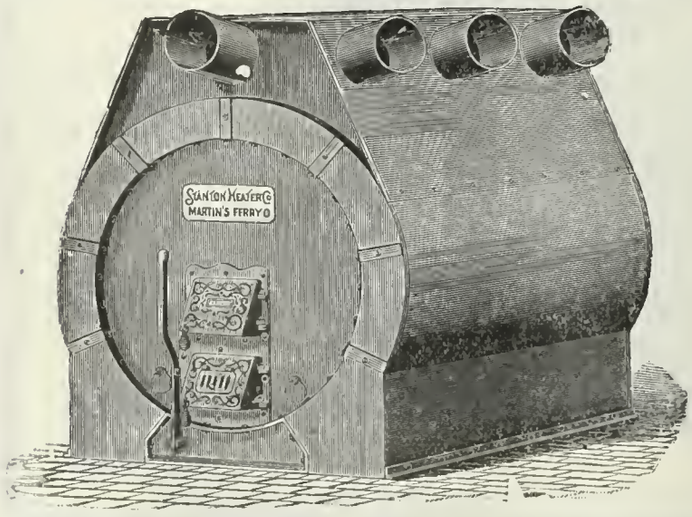


are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.



Send for our catalogue, it will give you a better idea of what we make.

FRONT RANK STEEL FURNACE CO.,
2301 to 2309 Lucas Ave., St. Louis, Mo.

The Stanton Seamless Heater,

PORTABLE CASED.

STATE COLLEGE, PA., June 15, 1900.

THE STANTON HEATER CO., Martin's Ferry, Ohio.

GENTLEMEN:—The Stanton Heater is giving the best kind of satisfaction. It will produce good heat from any kind of fuel. My average cost of fuel, per month, for the past winter was three tons of coal dust from soft coal to heat 43,000 cubic feet of space with a No. 68 Heater: however, this space is 3,000 cubic feet over the capacity of your Heater, but the heater did the work easy, and held the temperature in zero weather so it would not change over four degrees in twelve hours without touching the Heater.

The Stanton Heater is, in my judgment, the most modern and economical warm-air generator of this age.

Sincerely yours, J. N. KRUMRINE.

See Our Advertisement Next Week.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

HIGH GRADE HEATERS.

Some Dealers Look

to the profit they make on the sale of a single furnace, and if a cheap furnace is used the profit looks large when the contract

Is Made

When this cheap furnace fails to heat, and gives out in the middle of winter, the dealer is obliged to alter and readjust the setting, secure repairs for his furnace, and in the end the entire profit

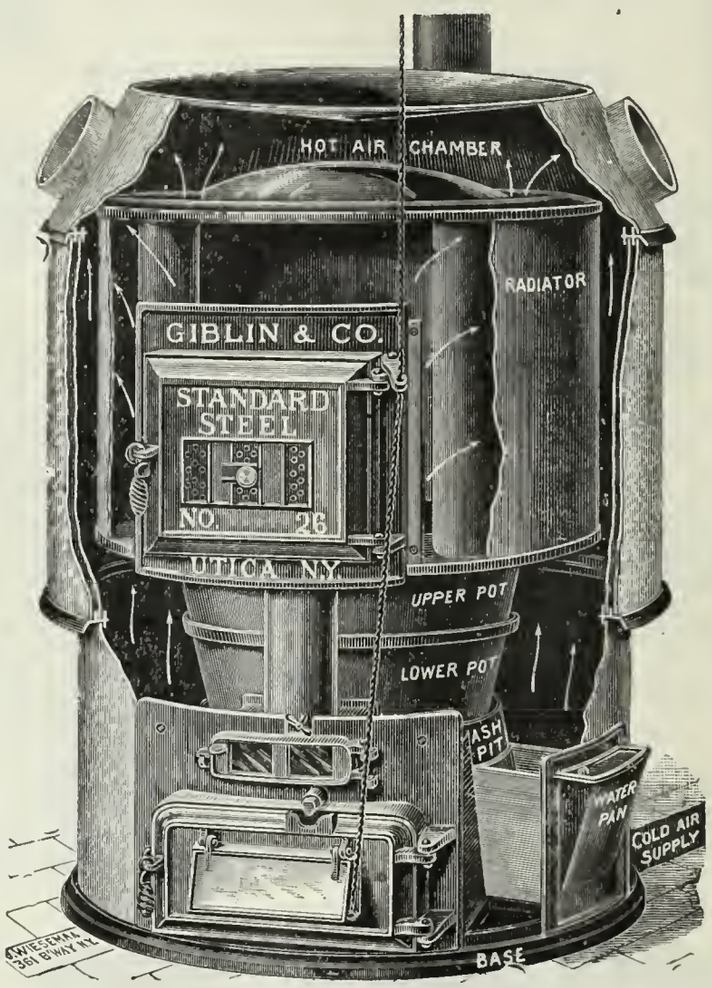
Is Wiped Out

and great disgust follows to both the purchaser and the dealer.

OTHER DEALERS INSIST

on using

Good MATERIALS WORKMANSHIP FURNACES.



The result of such choice is satisfactory heating, pleasant feelings between the purchaser and the dealer, and the

WARMEST RECOMMENDATION

of the furnace and the dealer.

A GOOD BUSINESS REPUTATION

is obtained, and when good work is wanted this dealer is sought out and fair prices paid for his work.

The Basis

of all heating is a

Good Furnace,

one that is **SIMPLE** in operation, **ECONOMICAL** in fuel and **LONG-LIVED** without the need of repairs.

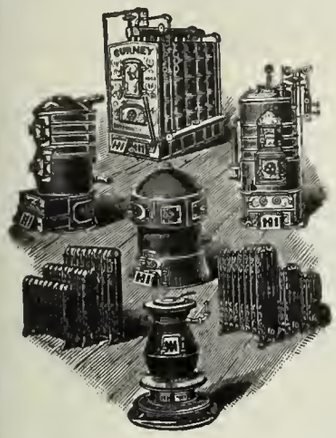
The furnace shown here has all these merits, and the actual use of

Many Thousands

of these heaters has demonstrated its superiority.

FURNACE DEALERS

who are trying to establish a



Good Furnace Business

should place themselves in communication with us, obtain our catalogue, see the line of heaters we make and get in position to do business on a good basis for the balance of the year 1902.

Our Prices are reasonable, and our treatment of our customers is

More Reasonable.

IT will pay you to know all about the "DIGHTON" Furnace so that you can talk intelligently when your customer asks about it.

Don't attempt to tell him "it isn't any good,—that the one you are agent for is better."

If he speaks about the "DIGHTON," the chances are he knows somebody that's got one and quite likely it may have been in a place where conditions allowed of a fair comparison with yours.

Don't be surprised if he tells you that the "DIGHTON" consumed a ton of coal less than yours in heating a nine room house.

We believe there isn't another Furnace made that will heat a given number of feet of space with as little fuel as the "DIGHTON."

We **know** that a fair test where conditions allow of comparison will thoroughly convince **you** and we shall have one more loyal supporter of the "DIGHTON."

WINCHESTER

The Heater manufacturer who jea'ously guards the Integrity of its customers Is the one the fitter ought to help. To aid the fitter to secure orders for the best of articles elevates the entire trade We aim to have the "WINCHESTER" heater the best of its kind. If we do not accomplish this, we can at least say that it has no superior. Smith & Thayer Company, Boston, Mass., 105 Beekman St., New York.

HEATER.

They regulate heat in residences, offices, stores, mfg. plants. Guaranteed.

The Howard Thermostat Co.

West Water Street, Oswego, N. Y.

No electricity or compressed air Simple as a heavy spring motor can be.

Would like to send you their catalogue and give a few reasons why you should sell their Heat, Valve, Draft and Damper Regulators. This should be an interesting topic. We have the most simple thermostat made; also the most sensitive. Only three parts—a sensitive and powerful sensitive plate, a heavy spring motor made of brass. and common pulley connections. Just enough material to do the work satisfactorily, but not one atom too much. They do "straight work," without the aid of outside agencies. No other thermostat on the market can do more with all of its electricity and compressed air connections.

THEY SAVE THE COAL

WHICH IS WASTED BY THE WRONG OPERATION OF FURNACE OR BOILER DAMPERS.

WHAT WE CLAIM.

"52 Years of Success"

A construction from which the greatest possible amount of fresh warm air can be obtained with the least amount of fuel. . . . . .

A PLEASED BUYER SAYS:

"I have used *twenty-five of your furnaces* in new houses I have built, and I shall continue to use them in preference to all other furnaces I have tried, and I have tried many kinds. They give the best of satisfaction in every case. I have a No. 48 Thatcher Tubular in my own house and I find it easy to run, economical, and a great heater. I cheerfully recommend it to all who wish to be warm and comfortable on a cold winter day."

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.

W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.

W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.

CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the *"CONTRACT AND ESTIMATE RECORD BOOKS"* come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, **$1.50**

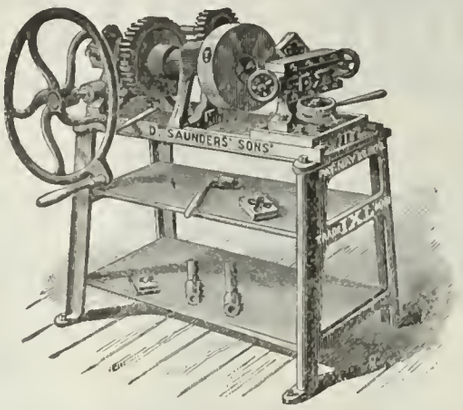
500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, **$2.50**

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, **$0.50**

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, **$1.50**



NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

The Climax

RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over bead, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe takes 2½, 3 and 4 in. die, $17.00

Tunnel Ventilation.

Owing to the disastrous accident which recently occurred in the tunnel of the New York Central Railroad in New York, news of which has reached all sections of the country, wide interest will be taken in the steps taken to obviate the conditions which caused it, now that sufficient time has elapsed for an investigation of the matter. For some time both the public and the authorities have been aware that some danger attached to the use which was made of the tunnel. In the light of what has been accomplished in other tunnels and subways, there were not wanting those who persistently advocated a proper ventilation of the tunnel as a means of safety. Last spring the authorities spent some time in investigating the conditions in the tunnel with a view to alleviating them. At that time the daily papers printed much matter regarding the vitiated atmosphere through which travelers were forced to pass in entering New York. But the question of the necessity of ventilation or some means of reducing the pollution of the atmosphere in the tunnel was left unsettled. Apparently the same opposition to ventilation was presented by those who had control of the tunnel that has been offered to the introduction of ventilating systems in every field where their use has been found a pronounced benefit. Instead of recognizing the fact that whatever method of alleviation might be adopted ventilation was a necessity, those who were endeavoring to improve the conditions in the tunnel apparently were willing to take what they could get, rather than to strive for something which could only be attained by a long continued effort, and looked to the substitution of electric traction through the tunnel as a solution of the problem. What has been accomplished by means of a ventilating system in the Boston subway is a matter of record. That the work can be duplicated by ventilating engineers in the New York tunnel is merely a matter of expense. At a recent meeting of the American Society of Heating and Ventilating Engineers a special committee, composed of experts, reported that their services had been offered to the authorities last spring, with the view of aiding in devising some system of ventilation. But, notwithstanding that the services of these experts were available, the question of ventilation was set aside for the time. It is to be hoped that whatever changes may now be adopted to insure the safe transport of passengers, they will be accompanied by a system of ventilation that will prevent passengers being forced to pass through a vile atmosphere, as has been the case heretofore, and which could be entirely obviated if the matter of ventilation was placed in the hands of any one of the many capable ventilating engineers available.

The Dynamite Disaster.

Deplorable as was the disaster attending the explosion of dynamite in the new subway in course of construction in New York, on Monday last, there will be some compensation if investigation of the cause leads to prevention of the illegal use of large charges of dynamite in connection with construction work in the city. For a number of years the rights of a large number of property holders have been violated by almost every man who had a contract for blasting out the cellar for some small new building. By the use of large charges of dynamite in blasting away the rocks, he has been able to complete his work quickly and at a comparatively small expense. The use of these large charges has shaken buildings for blocks around the point of his operations, causing the settling of walls, cracking of ceilings and cornices and, not infrequently, jarring the plumbing systems in buildings so as to cause cracks in cast iron soil pipes and water closet connections, that offered free entrance to the foul air from the drainage system, with all of its insidious influences. It seems a step backward when, for purely mercenary reasons, a contractor or a contracting corporation is allowed to come into the midst of a large city and use blasting charges which are a menace to the rights of all the surrounding property owners, to say nothing of the safety of citizens passing in the streets. Not a few accidents have occurred from the *débris* hurled by these blasting charges doing injury to persons who were taking due care to avoid accident and who suffered from the neglect of the city authorities to protect their rights. Had the complaints of those who were obliged to put up new ceilings and cornices or repair their plumbing systems received the attention that was their due the citizens would have been saved much expense, trouble and inconvenience. However desirable the saving of time by the use of high explosives for blasting purposes may be in the completing of large public work, it should not be necessary for such disasters as that which caused terrible injury and loss of life and the wreckage of many buildings in New York last Monday to induce action to protect public interests from the storage of large quantities of dynamite in exposed positions and the use of dynamite charges of illegal size.

Successful Arbitration.

The Arbitration Committee of the National Civic Federation already have the adjustment of one important labor dispute to their credit. By bringing together the president of the National Association of Clothing Manufacturers and the general secretary of the United Garment Workers of America, they have succeeded in healing a breach that has been open for the past year and have thereby averted a threatened strike of about 40,000 workers in the clothing industry. Through the intervention of the committee a satisfactory basis of compromise between the two interests was agreed upon.

One of the questions in dispute was the claim of the garment workers for an eight-hour working day, in place of the nine-hour day insisted upon by the employers. The two parties have been induced to meet each other half way and compromise on an eight and a half hour day. The value of the Arbitration Committee was fully illustrated in this instance. In the dispute in question each side was obstinately set upon the maintenance of its claims, but when brought together it was quickly found that the interests of each could be best served by a mutual compromise. It is understood that a meeting of the Arbitration Committee of the National Civic Federation will take place in New York City on February 19, when a definite plan of action regarding the arbitration of labor disputes will be submitted for adoption. In this connection it is gratifying to note that every one of the thirty-six distinguished men who were appointed on the committee at the meeting of the Civic Federation in New York early in December has agreed to serve.

Making Plans.

For a number of years it has been a part of the agreement which has produced the harmonious relations between the manufacturers of house heating boilers and the members of the National Association of Master Steam and Hot Water Fitters that, as far as possible, the manufacturers would refrain from making plans for the assistance of customers, except those who have already secured the contract for work. This feature of the agreement has been observed to such an extent that no serious complaints of violations have arisen. The report is now made, however, that a supply house in the Central West plainly state in a circular letter to the trade that, with a view to extending their business, they will make plans and specifications for all customers who place orders with them. This has caused the steam fitters to file a complaint against this practice, which is claimed to be productive of no good. It is urged that competent men in this line of trade are better able, through being on the spot, to calculate the cost of a given piece of work than men at a distance, who have nothing but the plans to guide them. In consequence they are often drawn into unfair competition, and must either lose a job or take it at lower figures than good business judgment would dictate as advisable. It is also pointed out that in some instances salesmen who are eager to make sales of apparatus are led to make plans and specifications and to estimate on work for prospective customers, making prices much lower than those at which the work could profitably be done. This practice not only works hardship to the whole trade by lowering the value of their work, but also loss to the contractor who has accepted work on the salesman's figures. There can be no doubt that while the members of the steam fitting trade are endeavoring to protect their own interests, there is good, sound business sense in the argument which they present. In view of the arguments presented it is thought improbable that the departure of the concern referred to from the course that heretofore has met general approval will be widely followed.

The Paris correspondent of the *Engineering and Mining Journal* informs the readers of that periodical that "The active campaign against the use of white lead as a pigment is gradually being developed. It is claimed that white lead poisons the painters who use it, and that it is injurious—though in much less degree—to those who live in dwellings painted with this material. Zinc white, it is said, is a material entirely free from these dangers and should be substituted for the lead."

The Exports of 1901.

The export record of the United States in the calendar year 1901 is very satisfactory, when its total is compared with that of 1900 or of any preceding year. While the apparent total falls about $12,000,000 below the figures of 1900, the fact that the export figures of 1901 do not contain any of the shipments from the United States to Porto Rico or Hawaii, which aggregated probably $30,000,000, shows that the grand total of shipments formerly classed as exports to foreign countries was in the year 1901 greater than in any preceding year. While there was a reduction of $100,000,000 in the value of exports of certain great articles, notably corn, copper, cotton and iron and steel, there was a sufficient increase in other articles, notably wheat, flour, provisions and cotton manufactures, to practically offset this reduction. The reduction in exports of corn, as is well known, was due solely to the great shortage in the corn crop, the total figures of exports for the year being but $50,361,388, against $84,284,733 in 1900, a reduction in round terms of $34,000,000. In cotton, while there was an increase of 155,000,000 pounds in the exportations, there was a decrease of $13.000,000 in value. Of copper, the value of exportations in 1901 was $33,534,899, against $57,542,610 in 1900, the decrease in quantity being proportionately about the same as that in value. In iron and steel there was a reduction of $27,000,000, the export figures for 1901 being $102,539,797 and in 1900 $129,633,480. This reduction in iron and steel exports was partly due to reduced prices and partly to a decrease in the quantities exported. In locomotives the number exported showed an actual increase, while the value showed a decrease of about $400,000. In various other manufactures of iron and steel the reduction in values was proportionately greater than the reduction in quantity, but there were material reductions in quantity in certain articles, such as bars and rods, steel rails, wire nails and steel sheets. Another indication that the reduction in the value of exports is due quite as much to a fall in prices as in quantity is found in the fact that while the quantity of refined mineral oil exported showed an increase of nearly 100,000,000 gallons, the value showed a decrease of about $1,000,000. The aggregate of practically $100,000,000 reduction in the exports of the five articles named is nearly offset by the increase in exports of wheat, provisions, live animals and cotton manufactures, cotton seed oil and oil cake, and leather and manufactures thereof. Add to this the further fact that the shipments to Hawaii and Porto Rico aggregated probably fully $30,000,000, and the record of 1901 will compare favorably with that of any preceding year.

To Cool the Air at the St. Louis Fair.

It is proposed to try an interesting experiment in the way of cooling the air at the international exposition to be held next year in St. Louis. The idea is to reduce the high temperature of the grounds during the summer months by drawing downward cool currents from an altitude of 800 to 1000 feet above the ground and distributing over the fair grounds air from 10 to 15 degrees cooler than the surface temperature. The plan, according to a published description, comprehends the construction of an aerial tower or stand pipe of the aforesaid hight, with lower termination about 50 feet above the ground, where large fans or blowers are attached that will draw a current downward at the rate of 20 or 30 miles an hour, equivalent to a pumping capacity of 500,000 cubic feet of air per minute. This volume of air will cover an acre 10 feet deep—in an hour 60 acres and in six hours 360 acres. It is expected that calefaction through the action of the sun's rays will be counterbalanced and neutralized by the constancy of the current during the daytime. After sundown the temperature, it is claimed, can be held below 80 degrees F. The fans are to be started at 4 a.m., when the air is coolest. By 10 o'clock the buildings and grounds would be filled with fresh air and so maintained during the day.

How to Plan a Warm Air Heating System.

BY C. E. OLDACRE.

The article published in *The Metal Worker* of December 28, 1901, under the title, "Some Hard Knots in Furnace Practice," is worthy of the careful perusal and thoughtful attention of every one interested in the furnace trade, be he engaged in the sale or the erection of furnaces. I have read it over several times, and each time something new has impressed me.

Possibly one can be entirely too verbose in the expression of ideas, but in this article, the writer, from the experience he has had, surely could have given expression to many more good thoughts and ideas, and related more impressions that he has gathered from various sources, with beneficial results to the heating fraternity.

The article in question is thought boiled down and would stand much elaboration that would be of great value to every one in the trade.

Quoting from the article, the writer says: "To start with, the furnaceman must ascend to the point of understanding that there are several fixed and unalterable laws governing the case." Furnacemen, here is one of the keynotes to success in our work. In fact, the keynote of success. There are no mysteries (strictly speaking) in furnace work. It is all cause and effect; the following of some immutable law of nature. The more we study these causes and effects, the more readily we can apply them in a general way to all our work.

OBSERVE AND RECORD.

Every furnaceman will recognize the fact that no two jobs are precisely alike in every detail. This being the case, it becomes all the more necessary for each and every one of us who may be endeavoring to produce the very best results from our work to thoroughly and clearly understand these causes and effects so far as possible and to have certain rules worked out and laid down that are gathered from our own and others' experience and study for our further guidance.

The further we get from the guess and the "cut and try" methods the nearer we will be to success. The chemist, when he desires to produce a certain known chemical, goes about his work in an absolutely methodical manner, using his various quantities in absolute proportions determined by weights and measures. He does not throw in a handful of this and some of that and some of this by guess and await possible developments. He experiments, of course, devising new combinations and new and possibly shorter and quicker methods, but not on the goods which he already has in the process of manufacture or is regularly manufacturing. Why should it not be so with us?

Take at random a dozen jobs that you have done in the last year and study the plan of each in all its detail. See, as nearly as possible, why some have been entirely successful and some only partially so. Study them all through, and if you will apply what you have learned to any that have not been all you might have wished them to be, I have no doubt but that you will see the means of remedying any such shortcomings.

CAUSES OF FAILURE.

After investigation of hundreds of heating plants, running well up into the thousands, I assign the following as the principal causes of many failures in hot air heating that have occurred in the past—but not occurring so frequently as we more closely study and clearly understand our various undertakings:

Furnace too small.
Furnace improperly located.
Draft not sufficient.
Cellar pipes not properly arranged.
Cellar pipes not properly proportioned.
Cellar pipes too small.
Some cellar pipes too large.
Insufficient pitch to cellar pipes.
Friction from the use of two-piece elbows.
Too much friction in various fittings used.
Failure to use fittings that provide easy turns.
Too much friction at bottom of stack or flue.
Lack of protection to cellar pipes when subject to currents of cold air.
Lack of fresh air duct.
Insufficient size of fresh air duct.
Lack of means for adjusting fresh air duct.
Fresh air duct taken from wrong side of house.
Fresh air duct taken from a point affected by adverse air currents.
Fresh air ducts closed entirely by slides.
Fresh air ducts wrongly connected to furnace.
Improper arrangement of return duct, where used in connection with fresh air duct.
Screen of too small mesh used over fresh air inlet.
Heat flues too small.
Heat flues improperly located.
Heat flues not proportioned to their work.
Heat flues not protected in outside walls.
Heat flues not protected at other cold points.
Heat flues diminished in size at various joints of stack.
Heat flues diminished in size in changing shape of same.
Heat flues diminished in size by register body projecting too far into flue.
Heat flues diminished by too small dampers.
Too many heat outlets on one stack.
Registers too small.
Register not of proper shape.
Register of too close pattern.
Lack of ventilation.
Too much cold air entering through loose fitting doors and windows.

CARELESS WORKMANSHIP.

Any one of the above is sure to cause trouble in one way or another, and all are to be studiously avoided. Look after last closely, and you may have time to look after the others.

From my experience of a number of years in laying out and in the erection of hundreds of heating jobs and from the personal investigation of many more, involving the placing of apparatus in houses ranging from 6 to 40 rooms, and where the pipes have varied in length from 3 to 70 feet and averaged in length from 10 to 30 feet, and in houses having from 10,000 to 175,000 cubic feet contents, I believe most any defect or failure of a hot air heating plant can be easily traced to one or more of the causes mentioned.

THE WEAK POINTS OF RULES.

I have seen quite a number of empirical formulas worked out by different men, and have looked into various "rules of thumb" for the proportioning of the heat pipes, but in all of them it has seemed to me that there has always occurred the omission of three very important factors that should enter into any calculation on the subject. These factors are: 1, The pitch or rise of the pipe from the heater to its outlet; 2, the length of the pipe in the cellar; 3, the friction due to angles and to transition pieces.

THE EFFECT OF PITCH.

The more decided is the pitch or rise of the pipe the greater is the ease with which the air will flow through the pipe and consequently the greater will be the volume of air for same proportionate size of pipe. The relation of the pitch of the pipes to one another should also be considered. The pitch of each pipe should enter into all calculations as much as any other factor.

The trade has been told that no cellar pipe should be over 15 feet long, and if longer ones were used it was risky. From my experience I cannot agree with such statements. Given a furnace of ample capacity for the work and no such limitation should be placed. Two or three times that length can be easily used if the pipe is properly proportioned to the work. In my work there are few cases where there are not one or more pipes of such lengths, and pipes that lead to important rooms where to meet the requirements 70 degrees must be maintained in zero weather.

FACTORS FOR CONSIDERATION.

In placing such pipes there are many factors that must be taken into account, such as the size of the room;

whether it is on the first, second, third or fourth floor; whether it is on the north, south, east or west side of the house; what is the extent of exposed wall surface and the character thereof; the amount of glass surface; the length of pipe; the pitch of the pipe in the cellar; the number of bends and points of resistance; the shape of the flue in the partition or wall; the loss of heat due to the cooling of the air in passing from the heater to the outlet; all of which are questions involved in determining the number of cubic feet of air brought into the room in a unit of time and the temperature of the entering air, &c.

RESISTANCE FOR HOT AIR CURRENTS.

I note in the article in *The Metal Worker* above referred to the following sentences: "Then what resistance does hot air meet with in a horizontal pipe? Presumably its own friction in passing through the pipe, irrespective of the direction in which the pipe is run. The resistance is encountered at the register box where it enters the cold room, and nowhere else." (The italics are my own.) To this I dissent, if I correctly construe the statements as given.

The velocity of the air in the pipe depends (not entirely, however), on the difference between the temperature of the air at its outlet and the external air, which, for the purpose of all calculations, is generally assumed to be at zero. If the pipe is subjected to cooling at any point or at various points from the heater to its outlet the velocity is consequently reduced. This affords a good reason for thoroughly protecting all pipes and tin heat flues with asbestos. The use of liberal quantities of this article will pay handsomely in the better results thereby gained. Again, the friction is greatly controlled by the size of the pipe, its shape, its length, its pitch and the character of angles or bends used throughout the run of the pipe to its outlet.

FRICTION FROM THIN FLUES.

The smaller the flue, the flatter it is, the longer it is and the sharper the angles or bends, the greater is the friction and the lower is the velocity. Is it not a mistake to speak only of the resistance to the flow of the air in the horizontal pipe? I assume that it is. The resistance with which it meets throughout the entire line from the heater to where it enters the room to be heated should be considered, and the cooling to which it is subjected throughout this line should also be taken into consideration. The well-known axiom will readily apply here, "The strength of anything is equal to its strength at its weakest point." Of course I do not mean to say that the register cannot be wrongly located, as the current of warm air can and may be still further subjected to other resistances and untoward influences.

THE EFFECT OF VELOCITY ON RAISING TEMPERATURE.

The question of the raising of temperature of the air within any room to a comfortable temperature, say 70 degrees F., when the outside temperature is below this point, depends upon the number of heat units brought into the room in a unit of time. In hot air heating we have to do this by bringing in a certain number of cubic feet of air carrying a certain number of heat units per cubic foot, or, in other words, having a flue of a given size, to maintain a certain velocity in this flue and to have the air of a certain temperature. Nothing more and nothing less. There are no further mysteries about the matter. The lower the temperature the lower is the velocity. The lower the velocity the lower is the number of cubic feet of warm air brought in through a flue of any given size. The lower the number of cubic feet of warm air the lower is the number of heat units conveyed to the space to be heated.

VELOCITY AND HEAT UNITS CARRIED BY AIR AT DIFFERENT TEMPERATURES.

For instance, it has been calculated that the velocity attained by a column of air 5 feet high at a temperature of 100 degrees F. in excess of the outside air is 240 feet per minute, whereas at an excess of 50 degrees F. it is only 165 feet per minute. Allowance here for friction and lower temperature is 50 per cent. That is, the velocity is reduced over 30 per cent., due to this drop or difference as stated in the two cases. Also, if the incoming air is brought in at 140 degrees F., each cubic foot will carry with it 2.2 heat units; if at 120 degrees F., 1.9 heat units; if at 100 degrees, 1.7 heat units, and if at 90 degrees, 1.5 heat units. But as the air escapes from the room at 70 degrees F. no part of heat contained in the air at 70 degrees can be used for the heating of the room; so at 140 degrees only 1.1 heat units can be utilized to counteract the losses through transmission.

DETERMINING THE SIZE OF PIPES.

Not any one size pipe will answer for the same number of cubic feet of contents in a room under any and all conditions. The nature of the exposure, the character of the walls, the square feet of exposed wall surface, the square feet of glass surface, the approximate changes of air per hour due to leakage and to ventilation through fire place chimneys or other means of ventilation, the velocity of incoming air and its temperature, as before spoken of, all must enter into any calculations we may desire to make as to size of the pipe required. Before the successful application of any rules or formulas for the size of heat pipes is made due consideration must first be given to all these controlling factors. Without it we might as well go back to guess work and take our chances for success or failure in our work.

We all have different ways of doing our work, and pursue different methods. Any rule without the coefficients stated for the various conditions met with in our work cannot be properly and correctly applied. But the coefficients for all these can be worked out, and, where rightly applied, are sure to bring about successful work.

Where is there a calling or business that affords more opportunity for the pleasant study of its various details than the heating business? I for one know of none, and the interchange of ideas that is afforded us through *The Metal Worker* cannot be otherwise than beneficial.

PIPES THAT ARE ROBBED OR HAVE REVERSE CURRENTS.

The last paragraph of the article referred to in *The Metal Worker* is quite interesting. The condition spoken of when one pipe takes all the heat and another is bringing down cold air has been observed by the writer. It can nearly always be accounted for by too small a furnace, too small or no cold air duct, cold air duct closed off entirely, or nearly so; too large a pipe in the one case and not large enough in the other, or more cold air by far coming into the room having the cold pipe than there should be from loose fitting doors or windows. The first two reasons given cover the matter in nearly all cases.

Only a few days ago the writer, in examining a job where there was a large brick set heater, removed a floor register that was directly over the main drum or body of the furnace, so that the top of the furnace could be seen. The entire body was red hot, yet there was not one particle of hot air coming from the flue. This register was located in a hall opening to the west. There were six other flues leading to rooms on upper floors, and all close to the heater. I found the fresh air duct closed off completely and any quantity of cold air coming in under a loose fitting door which was not more than 6 feet from the register. As soon as these conditions were reversed there was at once an ample flow of heat to the register, where before cold air was entering. As no cold air was coming in through the fresh air duct, and as air would be moved by the very hot surfaces if it was to be had from any point at all, it was very naturally taken in at the lowest outlet and from the coldest point, as that air would most easily fall and displace the heated air that was lighter and which had ample opportunity to seek higher levels.

DETERMINING THE SIZE OF FURNACE FOR USE.

Referring to the causes enumerated for failures in hot air heating apparatus, the first cause named—furnaces too small— will account for about as large a number of failures as any. In fact, I think I would be justified in saying that it is the cause of more failures than any two other causes named. The question of the size of heater to be used should be reckoned from the area of the grate in square feet or square inches and not by the casing size.

The amount of grate surface provided should bear a relation to the exposed wall surface and glass surface more than in relation to the cubic contents. The importance of this can be readily seen where a greater number of cubic feet of space can be heated in a church than in a private house, as in the first case we have a very much smaller amount of exposed wall surface for the cubic contents than in the second. A closer and more accurate way is the relation of the grate surface to the equivalent glass surface (E. G. S.). This is easily obtained by measuring the entire amount of outside wall surface in square feet and then subtracting from the amount obtained the square feet of glass in all walls and dividing the remainder by 4 (assuming that 1 square foot of glass cools as much air as 4 square feet of exposed wall), and then adding this quotient to the glass surface, which will give the equivalent glass surface (E. G. S.). If the house in question is one of a block, or a double house, add one-half of the party wall and count as exposed wall surface.

GRATE SURFACE AND EQUIVALENT GLASS SURFACE.

Taking good, first-class heaters of average construction, it will be found to be safe practice to allow 250 square feet E. G. S. per square foot of grate surface if 70 degrees F. is to be maintained with zero outside. Small heaters, owing to their greater ratio of heating surface to grate surface, will accomplish more than that, but as the larger ones usually receive more attention no allowance is made for this.

Some heaters will not accomplish this much except at a high rate of combustion of the fuel, while some will do more, owing to their having a larger amount of surface or on account of more effective surfaces. The latter ones can be relied on to accomplish the same work at a lower rate of combustion and a consequent saving of fuel.

AMPLE FURNACES INSURE ECONOMY.

I know some furnacemen will say that this provides a much larger heater than is necessary, in their estimation, but it is based on the idea of continuously and simultaneously heating all spaces as divided up in private houses to an average temperature of 70 degrees F. in zero weather, with a rate of combustion not to exceed 5 pounds of anthracite coal per square foot of grate surface. If a higher rate of combustion (which cannot be recommended) is determined on, or if a higher outside temperature is figured on, or if lower temperatures are to be maintained in all or part of the house, or if the heat is shunted or turned from one part to another as the apartments are used, as is often the case, then, of course, a smaller heater may meet the requirements.

THE EFFECT OF POOR CHIMNEYS.

There is nothing in the field of the heating business that can come nearer upsetting all one's calculations than a poor draft, that may come from any number of causes, but usually from chimneys of too small size. No matter how good the heater or how well laid out the work, or how well it may be executed, if the fire does not burn properly no good results can be expected. No chimney for a heater should be less than 8 x 12 inches throughout its whole length, and it should be carried up free of all roofs or other obstructing objects. It should also have no other openings in it than the ones for the smoke pipe from the heater and the clean out door below where the smoke pipe enters. As the furnaceman does not, as a rule, build the chimney, he should act only in an advisory way as regards the chimney and assume no risk for the draft, distinctly stating that he is not to be held responsible for the character of the same. Many good heaters have undoubtedly been condemned for no other reason than poor drafts.

THE FRESH AIR SUPPLY SHOULD BE AMPLE.

The fresh air duct should receive proper attention. It should be large enough to supply all the pipes at one time. It is an invariable rule that what is not put into a thing cannot be got out of it. In order to have all the pipes leading from the heater perform their allotted share of the work the duct must be made large enough to supply the required amount of air. It is the practice to allow all the way from one-half to the full area of all the pipes taken from the heater, but for a number of reasons I favor having the full area in most cases. If the supply of air is not sufficient then the pipes are sure to act very erratically and the distribution of the heat will not be certain and equal. The life of the heater will be very much shortened and the cellar will be unduly heated if there is not an ample supply of air.

The duct should be provided with a damper or valve, so arranged that the entire supply of air cannot be cut off at any time, but so that it can be reduced in size or effective area, as may be needed, during the time of high winds. If the entire supply is allowed to be cut off by the damper or slide it will be as bad as no fresh air duct, and, in fact, worse. You need not expect to see the rooms on the lower floors or on the windward side properly heated under this condition. A duct the full size of the pipes will be found best, as it will provide a full supply of air at all times and prevent any overheating that might take place at certain times.

Ducts built of galvanized iron are to be preferred, as they are sure to be tight and can be made much neater and occupy much less space than if made of wood. They, of course, cost a trifle more, but are worth more than the difference. Where underground ducts are used they should have walls of brick laid in cement and a brick or flagstone top, the same cemented over, and they should have a cement bottom. Underground ducts are to be avoided if there is any possibility of water getting into them.

The window frame to which the duct is attached should afford a free opening as large as the duct, and this after allowance is made for any bars or screens that may be over the opening. It is well not to use galvanized iron wire or other netting having less than a ½-inch mesh.

RETURN AIR DUCTS.

Return fresh air ducts are not to be commended, except that possibly they do save some fuel or permit of heating a larger space with a given sized heater than would be the case if the air was taken wholly from the outside. There are many more good reasons for not using them in first-class work than there are reasons in their favor. They are unsanitary, to say the least, and nullify one of the best arguments in favor of warm air heating—the constant supply of pure air. They are liable to cause trouble, require extreme care in their management and are not to be depended on, as a rule. They interfere with ventilation, and if there should be any sickness in the house the air from wherever it may come is taken down into the heater and again distributed to any and all points. As they convey the air through register faces and valves—either automatic gossamer valves or hand-actuated valves—good lodging places are afforded for microbes and germs of all kinds. Any saving in fuel is undoubtedly at the cost of health and the risk of possible protracted sickness. Return ducts are not necessary adjuncts of heating work, and were surely never intended for any purpose other than to increase the capacity of an otherwise inadequate heater. Plenty of pure air, with the health and comfort accruing therefrom, is more to be prized than the few dollars saved in fuel.

PUSH HIGH GRADE WORK.

First-class heating work costs more money to install than just putting in a heater in any kind of way. It should, and does, command a better price. It cannot be done in competition, on a price basis, with slipshod work, and no attempt should be made by any one to so compete. There is a fine field ahead for first-class warm air heating, and with the reputation of doing such work you should under no circumstances put your work on a par with the poorer class of work, of which there are plenty of examples extant. More and better materials are required for the better grade of work; larger heaters than are usually calculated on must be used, and the work requires more personal attention and supervision. Thus the service rendered to the customer should warrant a higher rate of compensation.

The Late Otto Germer, Sr.

The sudden death of Otto Germer, Sr., of the well-known stove manufacturing firm of Black & Germer of Erie, Pa., at the age of 68 years, which was briefly referred to in our issue of last week, called forth universal expressions of regret among a wide circle of business associates and friends Mr. Germer was one of the foremost and most enterprising citizens of Erie, and was held in high regard by all classes of the community. His connection with the city of Erie began in the early sixties. With his father he came from Germany, the land of his birth, and settled in Chicago. Later he removed with his family to Erie, where he married Miss Teresa Ebisch. After spending a few years in business in Tennessee, Mr. Germer returned to Erie at the time that the oil excitement was at its highest point. As a representative of the Jarecki Mfg. Company, he went to Titusville, Pa., and sold oil tools, at the same time investing judiciously in oil property. Gradually Mr. Germer extended his operations, and at the time of his death was very largely interested in the oil industry in Pennsylvania, West Virginia and Kentucky. Leaving Titusville many years ago he returned to Erie and engaged in the stove manufacturing business as a member of the firm of Black, Germer & Johnson. On the death of Mr. Johnson his partners purchased his interest and continued the business, subsequently establishing the big East Side factory, the products of which, the Radiant Home stoves and ranges, have acquired a national reputation. By his energy and business enterprise Mr. Germer accumulated a considerable fortune. In his social life he was the center of a large circle of friends, and was especially prominent in the German society of the city. He was also a leader in local Democratic politics. Mr. Germer was a member of St. Paul's German Evangelical Church and his contributions to religious and charitable objects were liberal. In addition to his wife, Mr. Germer leaves two sons, Edward and Otto Germer, Jr., and one daughter.

Faultless Steel Ranges and Cooks.

The Faultless Mfg. Company, 617 to 621 Austin avenue, Chicago, have issued a handsomely illustrated folder setting forth the special features of their Faultless line of steel ranges and cooks. The illustrations show the ranges and cooks in a variety of styles. The company state that the ovens used in these ranges are exceptionally large. They are so arranged that a No. 9 top can be had on any size. The steel cook stoves, as well as the ranges, have the tops, oven door frames and all other parts intended to stand a heavy strain made of malleable iron instead of gray iron. In all these constructions a wood extension to the fire box is not required. They will take in a 22½-inch stick of wood. The water in the incased copper reservoir is heated by contact, there being no reservoir damper. The heat, therefore, at all times is allowed to pass unobstructed around the oven, and, radiating down the flue, heats the water in the reservoir. The oven steel is riveted to the malleable iron oven door frames, making an absolutely air tight oven, which will not allow heat to escape nor cold air to enter. The company claim that their oven will never warp, buckle or fire crack. A pouch feed with end draft is furnished on all Faultless ranges and cooks. They are also arranged so that a water front can be had to fit the pouch, which is a new feature. The company have had long experience both in building and selling stoves, and consequently are not simply experimenting in bringing out this line of goods.

The Michigan Stove Company are favoring the trade with a series of folders, having one side beautifully lithographed in colors and the other side devoted to illustrations of their specialties. The engravings in colors give interesting illustrations of child life. The specimens which have just been issued treat of the Peerless-Garland, a base heating surface burner; the Oak-Garland, which is claimed to be the emperor of oak Stoves; the new Empire-Garland Steel Range, adapted to soft coal, natural gas or wood; the Sunlight-Garland, a medium priced base burner for anthracite coal, constructed of sheet steel and cast iron, and the Fireside-Garland, intended for wood only, which is a new departure in wood burning Heaters.

Death of Christopher Emrich.

Christopher Emrich, a pioneer stove manufacturer of Columbus, Ohio, died on January 18 at his home in that city, after a protracted illness from a complication of diseases, at the age of 74 years. Mr. Emrich was born in the Palatinate of Bavaria, and came to this country with his parents when a boy of 12, settling in Columbus. After completing his education he was apprenticed to learn the molders' trade at the foundry of Gill & McCune. He remained with the firm for 20 years, and in 1861 began as a manufacturer of stoves on his own account, at the corner of Livingston avenue and Scioto street, Columbus, where his foundry is still located. He had thus been in the stove manufacturing business for 41 years, and was one of the oldest manufacturers in continuous business in Central Ohio. Mr. Emrich stood high in the estimation of his fellow citizens and the trade at large. The funeral took place on January 21, at the South Congregational Church, Columbus. His widow and four children survive him. His only son, John G. Emrich, who has been the superintendent of his father's stove plant, will continue the business without interruption, maintaining the high standard of the Florence stoves and ranges established by the deceased manufacturer.

Building a New Plant.

A letter from the H. Wetter Mfg. Company, Memphis, Tenn., states that their entire plant was destroyed by fire on January 19. The total loss amounted to $250,000, which is covered by insurance amounting to $235,000. The company, however, have made arrangements for a factory in which they can turn out a large quantity of steel ranges and steel cook stoves within the next 30 days, and they expect to be making a full line of steel and cast stoves and ranges within the next five months. In the meantime, they state that their branch houses, located at Louisville, Ky., and St. Joseph, Mo., are equipped with a very good stock, and all their rush orders are being shipped to those branches. The company have arranged to erect an entirely new plant, which will be strictly up to date in every respect, alike in the character of the buildings and in their arrangement and equipment. This plant will be about the same size as the one which was destroyed by fire, and will occupy about a space of one block.

The Kelsey Heating Company.

The successful business that has been built up in the manufacture of the Kelsey warm air generator will in future be conducted by the Kelsey Heating Company, who succeed the old Kelsey Furnace Company, at Syracuse, N. Y. Practically no change, except in the name, has been made in the business or the management, and old customers and the trade generally will receive the same generous treatment that has always made trade with this house a pleasure. New energy will be devoted to the Kelsey generator, with a view to extending its sale, by bringing attention to the many excellent features of this special form of construction. Two points will suffice to interest warm air heating contractors in a closer investigation of its merit. They are the long fire travel and the large amount of hot surface, and its arrangement to utilize the full effect of the fire and to bring all the air passing through the generator in contact with the surface. The company inform us that the Kelsey warm air generators have been selected for warming the Second Reformed and the new Tabernacle Baptist churches in Syracuse, and that three generators will be used in the new Trinity M. E. Church at Oswego, N. Y. The company's New York office is at 239 Water street, under the management of L. V. Sanford.

ODD PLATES.

The Alexander Furnace & Mfg. Company, Lansing, Mich., are favoring the trade with an exceedingly artistic wall calendar. A duck shooting scene is shown in colors. The card on which this is mounted is of a deep red, while the leaves for the months are of a lighter tint.

The Keith Furnace Company, Des Moines, Iowa, are distributing a fine large wall calendar, poster style, bound in brass at the top and bottom. It gives illustrations of the company's Monitor Furnaces. Leaves for the months, having very large figures, are attached to the bottom of the hanger.

The Columbus Stove Company of Columbus, Ohio, have been incorporated, by J. W. Hastings, F. B. Everett, J. C. Campbell, S. F. Jones and G. A. Willing, with a capital of $50,000.

T. J. Gibson & Co., Holyoke, Mass., have the contract for roofing the factory of the Hampden Glazed Paper & Card Company. The firm are also roofing two blocks which John St. John is building in Holyoke.

Ed. Q. Smith, representative of the Buckwalter Stove Company of Royersford, Pa., who makes his headquarters at Easton, Pa., announces his visits among the trade by means of special envelopes of red paper. Prominent on some is the capital letter "S," heading the words "Smith Sells Stoves." On the reverse side of one of these envelopes is the trade-mark of the Buckwalter Stove Company, and a large "S" arranged in the text, "When you think of Stoves, think of Smith and the kind of Stoves he sells."

The Pittsburgh Stove & Range Company of Pittsburgh, Pa., are sending to the Furnace trade a card well calculated to attract attention to their new Etna Furnace. Those interested in Furnace heating will be glad to secure this card, which bears a picture of two dogs, and are likely, further, to ask for a catalogue of this new production in the Furnace line of the company.

The Stanton Heater Company, Martin's Ferry, Ohio, report that they are more busily engaged than usual at this time of the year, and their outlook for the future promises even better for the sale of the Stanton Hot Air Furnace than heretofore, now that it has had an opportunity to demonstrate its efficiency.

F. W. Stelling, Hartford, Conn., will do the tinning in connection with the changes in the cold storage building of the Hartford Cold Storage Company.

The new Gas Range, Superb Fire King, which is being introduced to the trade by A. Weiskittel & Son of Baltimore, Md., is proving very popular, and the manufacturers report for it a large sale. One of its important features is an improved white enameled top which can be readily thrown back for the purpose of cleaning it, as well as the burners. The concern are also bringing out a new line of hot plates constructed with lift out burners and hinged rings, which are referred to as something of a novelty in this line.

C. D. Rounds, who represents the Abram Cox Stove Company of Philadelphia in New York State outside of New York City, has removed from Buffalo, where he has lived for the past ten years, to Central Square, near Syracuse, N. Y., which will be a more central location for him and will better enable him to tend to the needs of his customers.

The old Empire Stove Foundry, at Troy, N. Y., was destroyed by fire on January 28. The foundry, which was one of the pioneer plants of the Troy Stove industry, has not been in active operation for a number of years.

The Curtiss & Pierpont Company, New Haven, Conn., have been given the contract for the Tin roofing &c., on the new factory building for the Winchester Repeating Arms Company.

S. F. Shafer of Findlay, Ohio, is organizing a company to manufacture a new line of Stoves and Radiators invented and recently patented by him.

Charles C. Heath & Co., Baltimore, Md., have been appointed selling agents of the products of W. H. Colebrook, Sons & Co. of Syracuse, N. Y., for Philadelphia, Baltimore and adjacent localities. The last named company are well known as manufacturers of Colebrook's Asbestos Cement, Stove Putty, &c.

The plant of the Ferris Stove Works has closed down pending the final decision of the directors of the company in regard to the removal of their factory to Terre Haute, Ind.

More than a passing impression will be made upon the Stove trade in the interest of the Acorn line by the "Legal Notice," which is being sent out by Carey A. Moore, one of the salesmen of Rathbone, Sard & Co., Albany, N. Y., stating that the party of the third part—Mr. Moore—is desirous of forming a triple alliance in which Rathbone, Sard & Co. and the Stove dealers will be made parties of the first and second part respectively, through the efforts of Mr. Moore in establishing new agencies for the Acorn line of Stoves and Ranges.

Secretary A. H. Dane of the Kalamazoo Stove Company, Kalamazoo, Mich., states that the company's new plant will probably be ready to begin operations about March 1. They will employ at the start about 60 men, but this number will be increased as the plans of the company are completed. The patterns for the different styles of Stoves and Ranges to be manufactured have been completed and progress on the works is going on rapidly.

The annual meeting of A. T. Nye & Sons Company, manufacturers of Stoves and Ranges, Marietta, Ohio, was held recently, resulting in the election of the following directors: H. B. Nye, A. T. Nye, G. L. Nye, M. C. Nye and M. N. Nye. The directors elected G. L. Nye president; M. C. Nye, secretary; H. B. Nye, treasurer, and A. T. Nye, manager. The company's annual report made a gratifying showing, and their prospects for the coming year are said to be flattering. The company's business has grown to such proportions that a large three-story addition to their plant was rendered necessary. This has just been completed, and it will provide the concern with a considerable increase of facilities for producing and handling their goods.

F. W. Trauschke, formerly with D. B. Montague of Springfield, Mass., is now located at 6 Auburn street, Springfield, and will be pleased to receive catalogues from Furnace manufacturers.

The profit-sharing plan of the Scranton Stove Works of Scranton, Pa., referred to in a recent issue, has called forth grateful expressions from the employees who were benefited by it. The molders in the employ of the concern held a meeting a few days ago and tendered a vote of thanks to the company with an expression of appreciation of the interest shown in the maintenance of cordial relations with their employees.

A local report from Phillipsburg, N. J., states that a Stove manufacturing company of Weissport, Pa., are negotiating for the plant of the Phillipsburg Stove Company for the purpose of starting the manufacture of Stoves in Phillipsburg.

The Gunter Stove Works, Bridgeport, Ala., is being put in order and the plant placed in thorough repair for resumption of operations.

The Lizzie Lowman Stove Works, Sheffield, Ala., are about to erect another building adjoining their present site. This addition will about double their present capacity.

The contract for the Hanks Foundry Company's new building at Rome, Ga., has been let and work on the same has begun. This is an industry established on the co-operative plan. Several months ago about a dozen men agreed to pay $25 per month into a fund to be used in establishing a Stove and Cast Iron Specialties plant. Most of them were employees of other foundries. They met their monthly obligation without trouble, often paying in more than the stipulated amount. The money is now all in hand for buildings, patterns, &c., and it is expected that they will be ready for operation by April 1. J. D. Hanks, who was the prime mover in the scheme, is at the head of the new company.

The Grander Stove Company, Royersford, Pa., resumed operations last week, after a shut down of several weeks for repairs.

At the annual meeting of the stockholders of Rathbone, Sard & Co., held at Albany, N. Y., on January 29, the following trustees were elected: Grange Sard, Edward Bowditch, Robert Shaw Oliver, William H. Sard, Edmond Raftery and Arthur M. Blanchard. At the trustees' meeting, held after the stockholders' meeting, the following officers were elected: Grange Sard, president and general manager; Edward Bowditch, first vice-president and treasurer; Edmond Raftery, second vice-president, and Aurora manager; Arthur M. Blanchard, secretary, and Robert Shaw Oliver, general superintendent.

The Keystone Stove Foundry, Spring City, Pa., have started their foundry and will be ready to fill all orders for repairs of Stoves and Ranges formerly made by the Schuylkill Valley Stove Company. The Keystone Stove Foundry are dressing over many of the goods formerly made by the Schuylkill Valley Stove Company, which will be presented to the trade by their salesmen, and E. B. Colby & Co., New York, their authorized agents, as soon as the goods are ready. The Keystone Stove Foundry are a pushing young concern, who mean to do business, and their goods are guaranteed to meet all the requirements of the most exacting dealer or consumer.

Richard B. Tippitt and Emil Budnitz have been appointed by the courts as receivers for the Chesapeake Stove Company of Baltimore, Md., on the application of the Board of Directors of that concern.

The annual meeting of the stockholders of the Patric Furnace Company, Springfield, Ohio, was held at their offices on the 20th ult., when the following officers were elected: President, I. W. Rodgers; vice-president, Lewis Patrie; treasurer, Robert R. McGregor; secretary and general manager, C. F. Smith. The report of the company showed that they did an excellent business in the past year, scoring a very heavy increase over the year preceding. The company have received official notification of the issuance of a patent on their new Hot Blast Furnace. They have recently greatly enlarged their facilities by the building of a new modern foundry plant at the rear of their factory building, and have just entered into an arrangement by which they will begin the manufacture of a line of Kettle Heaters, Farm Stoves and Butchers' Boiling Outfits for the benefit of the local agricultural interests.

A fire on the afternoon of January 28 destroyed the old Empire Stove Foundry, at the corner of Second and Ida streets, Troy, N. Y., with a loss estimated at more than $30,000. The flames originated in the Scale works of James Hislop on the first floor. The foundry, which had not been used for Stove making purposes for a number of years, was occupied, in addition to the Hislop Scale Company, by the Ida Hill Nickel Works, the Empire Stove Repair Works and Frank Henderson, who conducted a tin shop and Sheet Iron Heater business. The Empire foundry was the second oldest Stove foundry in the city of Troy, and had been occupied by a number of Stove manufacturing concerns since the year 1844.

Reports regarding the American exposition to be held in the Crystal Palace, near London, from May to October of this year, indicate a successful undertaking, at least so far as regards the number and quality of exhibits. These exhibits will be confined exclusively to United States products. It is stated that applications have already been received for over 75 per cent. of the available space, and that other exhibits which are practically assured will easily fill the remainder. The desire of the promoters is to secure a thoroughly representative exposition, embracing all sorts of American manufactured goods, particularly in the line of machinery. Among the applications received are those of some of the most representative American firms in this line. The American Advisory Committee in London who are managing the preliminaries include many representative names. Among the number are Henry S. Downe, representative of the American Radiator Company; J. W. Lowner of the National Tube Company, Clark Harrison of the United States Pipe & Foundry Company and Thomas J. Farrell of the American Steel & Wire Company. From present indications it would seem that the proposed enterprise will be the most complete exposition of American manufactured goods ever held abroad.

The Clark Novelty Company.

The Clark Novelty Company, Rochester, N. Y., who are extensive manufacturers of milk can, cream separator, oil can and numerous other sizes an dstyles of brass faucets used for various purposes, are enjoying a very large trade in this particular line of goods. On account of the continual growth they have designed and manufactured many special machines and tools for the finishing of this class of work. The reputation of the concern for furnishing excellent goods is an enviable one, as they have no record of any complaints of leaky faucets during 1901. A representative of the company who has just returned from an extensive Western trip, where he has been shaking hands with the trade and incidentally securing their orders for the coming season, reports business as being good, especially in this line.

The Clark Novelty Company are also well-known manufacturers of all kinds of metal specialties. They operate a large factory, which is fitted with special machinery and tools, and are in position to execute orders for anything in the way of metal goods, light machinery, special tools, &c. They are the inventors and manufacturers of the well-known Clark kerosene oil heating system for heating soldering irons, capping steels, &c. which is becoming largely adopted in canning factories, tinware and sheet metal manufacturing establishments and for other purposes where a heat of this kind is required. Those who operate a system for this purpose would do well to correspond with the Clark Novelty Company.

The Standard Oil Can.

We illustrate herewith the Standard oil can manufactured by the Standard Oil Can Company, Toledo, Ohio, which, the manufacturers claim, possesses a number of points of advantage over other oil cans. A feature of the can is that it is so constructed that it is impossible to overthrow a lamp in filling it. Another point is that the construction of the pump in the can is so arranged that it can be taken apart and repaired and put together again readily, which is not the case with other oil pumps now on the market. The can is manufactured out of the best galvanized iron and tin. It is neatly painted and provided with a cover, which is also painted, preventing it from rusting. The can is made in two sizes, of 3 and 5 gallon capacity. Although the article has been but a comparatively short time on the market, the manufacturers report that they have received orders for these goods from the Atlantic to the Pacific, and from Northern Michigan to the Gulf. Although the company's factory is now working to its full capacity ten hours a day, they state that they are 3000 cans behind on their orders.

The Standard Oil Can.

Hardware Organizations.

Kansas Retail Hardware Dealers' Association.

The fourth annual convention of the Kansas Retail Hardware Dealers' Association was held at Kansas City, Kan., January 16. The headquarters of the association were in the rooms of the Mercantile Club. On account of the illness of President Anderson there was no prearranged programme, and the session was occupied principally in discussing the best methods of obtaining a larger membership, getting hardware dealers in the same town to become better acquainted with each other and other questions of interest to the hardware trade.

Irving A. Sibley, member of the Executive Committee of the National Retail Hardware Dealers' Association, was present at the meeting and delivered a very interesting address on the history and work of the association.

In the absence of the president, Mr. Anderson, Vice-President Oscar Roehr presided, and addressed the meeting as follows:

VICE-PRESIDENT'S ADDRESS.

As presiding officer of this convention the first duty I have is a sad one. It is with extreme sorrow and regret that I announce the severe illness of our president, George Anderson of St. Mary's, Kan. Sorrow for a personal friend and regret that his affliction makes his absence at this meeting unavoidable.

About six months ago Mr. Anderson had an attack of paralysis, which left him entirely helpless. I have a recent letter from his son stating that Mr. Anderson is now unable, and has been for six months, to converse or communicate his ideas in any way, although I believe that his intellect was not affected in the least by the stroke of paralysis which he suffered.

We congratulated ourselves at the last meeting when we elected Mr. Anderson that we had in him an officer eminently equipped for the position, and who had the necessary push and energy to put this equipment into practical use for the benefit of the association. Nor were we mistaken. It was largely through the instrumentality of Mr. Anderson, as the head of our association, that a bill was introduced in our last Legislature licensing peddlers and venders of certain commodities, the principal item of which as hardwaremen we were interested in being stoves and steel ranges.

Mr. Anderson was at the Capitol continually while this bill was being debated, and worked unceasingly until the bill was passed and became a law. Undoubtedly he had other measures in mind for the benefit of the association, which his unfortunate illness prevented him from putting into effect. In his absence to-day we miss a friend and benefactor; therefore let us all hope for his speedy recovery and ultimate return to active life.

I regret and rejoice that the year just passed has not shown any material increase in our membership. Regret for the association and rejoicing for the cause of this lack of growth. Our hardware merchants have undoubtedly had a prosperous year; so prosperous, in fact, that they have had all they could attend to with their immediate business, and as a result interest in association work lagged. The old adage, "Make hay while the sun shines," was never more applicable, for, as surely as night follows day, business depression is bound ultimately to succeed an era of prosperity, and it is at such times, when competition grows hard and merchants are inclined to become aggressive in various ways, that a strong fraternal association at your back is a mighty satisfactory ally.

Personally I have received much pleasure and benefit as a member of this association, and have made many friends whom I prize highly. I feel strongly the honor I have in presiding at this meeting, and my only regret is that there is not a larger membership present.

We should have with us to-day at least 300 members, and this would only be about one-third of the hardware merchants of Kansas.

During this convention I will ask for a short session, devoted entirely to the enlarging of our membership. I thank you for your kind and courteous attention, and now declare the fourth annual convention of the Kansas Retail Hardware Dealers' Association open and ready for business.

The minutes of the last meeting were then read and approved. J. A. Cole, Topeka, then presented his report as secretary-treasurer, as follows:

SECRETARY'S REPORT.

The past year has been an eventful one, and while the Kansas Retail Hardware Dealers' Association has not perhaps prospered to the extent of some of the retail hardware dealers' associations in other States, we may have had more to contend with, as the general verdict is that business has been very good in Kansas this past year, which means that the live hardware merchant has been kept busy with his immediate affairs, and had very little time to think of what benefits might be derived from an association with other dealers.

Your secretary has to report that not one complaint has been received from any of our members, neither that the wholesale hardware houses were selling goods to the consumer nor that the consumers were not buying goods enough from them. Nor has he heard of the steel range people peddling their steel ranges throughout the State, as he had the year previous. Perhaps the bill which our president worked very hard to get through the Legislature, and finally succeeded in getting it to be one of our laws, may have had some effect toward stopping them.

The bill is as follows:

CHAPTER 271.

REQUIRING PEDDLERS TO TAKE OUT A LICENSE.

An act defining peddlers, requiring them to take out a license, fixing the fee therefor and providing penalties for the violation of this act.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF KANSAS.

Section 1. Whoever shall deal in the selling of patents, patent rights, lightning rods, goods, wares or merchandise, pianos, organs, sewing machines, except patent or other medicines, books, charts, maps and nursery stock, agricultural and horticultural products, including milk, butter, eggs and cheese, by going about from place to place to sell the same, is declared to be a peddler.

Sec. 2. No person shall deal as a peddler without a license, and no two or more persons shall deal under the same license, either as partners, agent or otherwise.

Sec. 3. Every license shall state the manner in which the dealing is carried on, whether on foot or with one or more beasts of burden, the kind of cart, wagon or carriage, or, if on the water, the boat or vessel to be employed.

Sec. 4. Any person may obtain a peddler's license by applying to the County Clerk of the county in which he wishes to carry on his trade and by paying the amount herein provided for said license.

Sec. 5. Each peddler shall pay a license tax for the use and benefit of the county in which he intends to carry on his trade, at the following rates: 1, If a peddler travels on foot and carries his goods on foot, $3 for every period of six months; 2, if the peddler travels with one or more horses, or other beasts of burden, $10 for every period of six months; 3, if cart, wagon or other land carriage is used, $50 for every period of six months; 4, if a boat or other vessel is used, $100 for every period of six months.

Sec. 6. All sums received by the County Clerk for peddlers' licenses shall be by him deposited with the County Treasurer and covered into the county general fund for the use of the county.

Sec. 7. Any person who shall be found dealing as a peddler without having paid for and received the license herein specified, or who shall, upon the demand of any sheriff, constable or any householder of the county, refuse to produce his license and permit the same to be read, shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be fined not less than $1 nor more than $100.

Sec. 8. The provisions of this act shall not apply to the selling or peddling of any goods by the owner or his agent in the county in which the *bona fide* owner or agent is a resident tax payer, or in any county immediately adjoining thereto, where such goods are sold or peddled by the owner or from the store or place of business in which the owner keeps a stock of the same kind of goods that are so sold or peddled; and the provisions of this act shall not apply to traveling salesmen doing business with retail merchants, manufacturers or jobbers, or with State, county, township and city officials, whether they carry samples or not; and nothing contained in this act shall be deemed to conflict with or modify the provisions of section 1 of chapter 157 of the session laws of 1897.

Sec. 9. This act shall take effect and be in force from and after its publication in the statute book.

Approved March 2, 1901.

I do not hesitate in saying that this peddlers' license bill would not have been passed last winter had it not been for the untiring efforts of Mr. Anderson, and if it does what we hope and intend it should do the Kansas Retail Hardware Dealers' Association may congratulate themselves, and thank Mr. Anderson that the results of the past year have been by far the best of any so far in our history and something to be proud of.

COMMITTEE ON RESOLUTIONS.

The following Committee on Resolutions was appointed by the chair: Jos. H. Hamilton, Arkansas City, Kan.; T. H. Kinlry, Beloit; F. W. Bartlett, Kansas City, Kan. The committee reported the following resolution:

Resolved, That it is with great sorrow that we learn of the sad affliction to our president, George Anderson of St. Mary's, Kan., and extend to him our heartfelt condolence and hope for his speedy recovery.

The association extended their sincere thanks to the Mercantile Club for the use of their very comfortable rooms for the meeting.

The secretary was instructed to send out a circular letter to all retail hardware dealers in the State and try and interest them in the association.

ELECTION OF OFFICERS.

The following officers were elected for the ensuing year:

PRESIDENT, Oscar Roehr, Topeka.
VICE-PRESIDENT, E. I. King, Logan.
SECRETARY AND TREASURER, J. A. Cole, Topeka.
EXECUTIVE COMMITTEE:
F. W. Bartlett, Kansas City.
T. H. Kinlry, Beloit.
J. M. Walters, Robinson.
Jas. H. Hamilton, Arkansas City.
T. J. O'Neil, Osage City.

Retail Hardware Association in New York State—Who Will Start It?

Several suggestions have been made from time to time looking to the organization of a retail hardware dealers' association in New York State, but thus far nothing has been done. The matter is broached again in the following letter from a merchant located in a town in the central part of the State:

> Can there not be some effort made during the winter months to organize the dealers in this State? It seems to me we are making a mistake in not giving more attention to this matter.
>
> We fully agree with a recent correspondent who said he believed it was a great advantage to any dealer to meet others engaged in the same business and exchange ideas and compare methods. None of us are yet too old to learn.

It is generally conceded that much may be accomplished for the welfare of the trade through a State association. This is indicated in the success which has attended those which have been formed during recent years in the West. That there is a good field for an association in New York, and that there are evils and abuses connected with the hardware business which call for correction, is freely admitted. The jobbers in the State have been organized for years and have a strong association, which is understood to have yielded splendid results. The sister State of Pennsylvania is getting its hardware merchants into line. The trade are apparently waiting for some public spirited and enterprising merchant to take the matter up and give a little of his time to the launching of an association, calling a meeting at some accessible point, where the nucleus of an organization may be developed.

Missouri Retail Stove and Hardware Dealers' Association.

In our last issue we referred to the programme for the meeting of the Missouri Retail Stove & Hardware Dealers' Association at St. Louis, February 18 and 19, at the Mercantile Club. We are requested to state that a fare of one and a fifth has been secured from the Pennsylvania Railroad, date of sale February 15 to 21, good to return up to March 1. Parties attending meeting should buy ticket to St. Louis and secure certificate from agent, which when signed at St. Louis by the secretary of the association will insure a return ticket at one-fifth fare.

In a circular relating to the convention the following appeal to Missouri hardwaremen who are not members of the association is made by the secretary, Frederick Neudorff, St. Joseph:

Mr. Hardwareman:

Concentration, consolidation and combination are the factors in the business world to-day. The union of capital on the one side, the union of all labor on the other, is a fact and has been for some time. The only unorganized body are the middlemen or merchants. What the outcome of this tendency will be no one can foretell. But don't you think it a part of wisdom to be prepared for whatever the future has in store? Singly we can do nothing, united our influence will be respected. Much has already been accomplished by the association for our benefit. It is not just that the few should carry all the burden, and we ask you to become one of us by sending your name and $3 to the secretary and meet with us at our annual meeting.

Ohio Hardware Association.

We are just in receipt of the programme for the eighth annual convention of the Ohio Hardware Association, on Tuesday, Wednesday and Thursday, February 25, 26 and 27, at Columbus. The headquarters of the association will be at the Great Southern Hotel, where the meeting will also be held, there being a large convention hall connected with the hotel. An interesting programme has been prepared and the opinion is expressed that the Ohio hardwaremen who do not attend will miss a treat.

The convention will be called to order on Tuesday afternoon at 2 o'clock, with prayer by the Rev. Dr. Washington Gladden. An address of welcome will follow from J. Y. Bassell, secretary of the Columbus Board of Trade, the response being made by President Scott for the association. The remainder of the afternoon will be devoted to hearing reports, appointment of committees and routine work. The morning session on Wednesday will be opened by A. Rothwell with an address on the subject of "Stoves." This will be followed by report of Committee on National Association, J. P. Duffy, chairman. Hon. F. B. Willis will then address the gathering on the "Iron Industry." W. P. Bogardus, chairman, will report for Committee on Lien Laws. At the afternoon session J. H. Smith of Smith Bros. Hardware Company, will address the convention on "The Traveling Man," and C. W. Jewell will discuss "Honorable Success." The contents of the Question Box will be analyzed at this session. F. A. Powers will read a paper on Thursday forenoon on the topic, "Some Hardware Dont's." In the afternoon the convention will come to a close with reports of committees on resolutions and nominations, election of officers, &c.

On Tuesday evening the members will be the guests of the Columbus dealers, who have arranged a musical entertainment for their benefit. Wednesday evening the annual banquet will occur at the Great Southern Hotel. The speakers at the dinner will be Governor Nash, Hon. F. B. Willis, Colonel Kilbourne, and Henry C. Wiseman.

Geo. M. Gray, Coshocton, corresponding secretary, requests us to announce that the association has secured a railroad fare at one and a third rate on the certificate plan from all points in Ohio.

The Chicago Hardwaremen's Annual Ball.

The Chicago Retail Hardware Association held their ninth annual reception and ball in the North Side Turner Hall, Chicago, on January 22, under the management of the following committees:

Executive Committee: A. J. Englehardt, chairman; Fred. Ruhling, secretary; J. L. Smith, treasurer; W. B. Costello, H. E. Rebman.

Reception Committee: D. McLaughlin, chairman; James Gormley, C. F. Wooley, Martin Engelhardt, A. L. Peterson, Frank F. Porter, E. R. Schlick, J. H. Bixler, C. Carr, Jr.; George J. Pfeiler, W. M. Powers, Otto Hagen, John Schubert, William Winkenwerder.

Floor Committee: W. T. Gormley, chairman; George A. Neeb, George A. Englehardt, E. Sander, A. L. Adam, W. J. Krueger, O. Stebbins.

Refreshment Committee: G. R. Lott, chairman; H. E. Gnadt, J. F. Borchardt, S. Melohn, F. H. Schanze, H. C. Peppler, J. Hora.

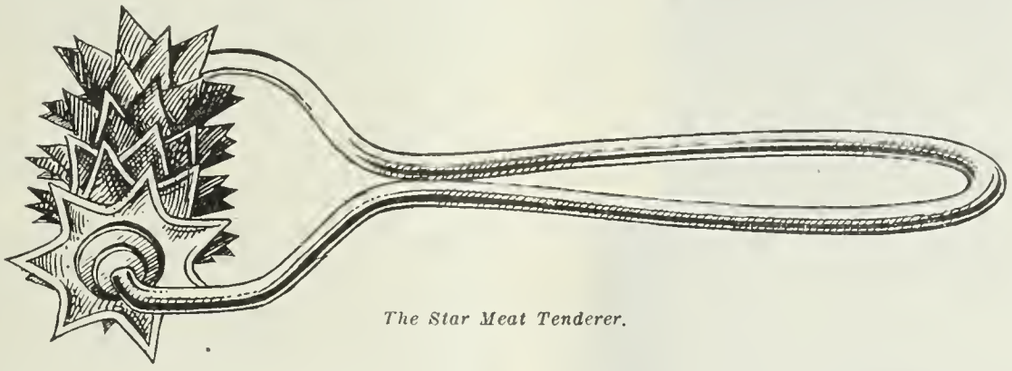
The ball was very successful in every respect. The members and their friends turned out in great force and passed a most enjoyable evening. The various committees discharged their duties admirably, all the arrangements contributing to the complete entertainment of those in attendance. The Chicago dealers have always assiduously cultivated the social side of their organization while vigorously pushing the features which have made their association a source of practical benefit to the members. Interest is thus doubly maintained and continuous growth is the result.

Pacific Retail Hardware Association.

The annual meeting of the Pacific Retail Hardware Association was held on January 15 and 16 at Nevada City, Cal. The gathering proved to be a pleasant and profitable one. A good representation of the membership was in attendance. Among the papers read at the meeting were: "Reciprocity in Trade," by Oscar C. Schulze of Dixon; "The Social Side of Business Life," by A. F. Brady of Grass Valley; "Credits and Collections," by Thomas B. Gibson of Woodland.

A number of jobbers and their representatives were present by invitation at the afternoon session on the 16th. Most of the former officers were re-elected for the coming year, as follows:

JOHN C. WHITE, Marysville, president.
OSCAR C. SCHULZE, Dixon, vice-president.
WILLIAM EARLL, Chico, treasurer.
R. W. BOYD, Marysville, secretary.
J. B. GIBSON, Woodland, member Executive Committee.
A. F. BRADY, Grass Valley, member Executive Committee.



It was decided to hold the next annual meeting at San Francisco. On Thursday evening a fine banquet at the National Hotel was tendered the association by the Hardware merchants and business men generally of the city. Over 100 covers were laid and the occasion proved most enjoyable. Judge F. T. Nilon presided as toastmaster. The following toasts were responded to: "The Association," Oscar C. Schulze; "Co-operation," Hon. E. M. Preston; "The Steel Industry of the Pacific," A. L. Scott of San Francisco; "The Future of San Francisco," Andrew Carrigan; "Uncle Sam Abroad," A. C. Rulofson.

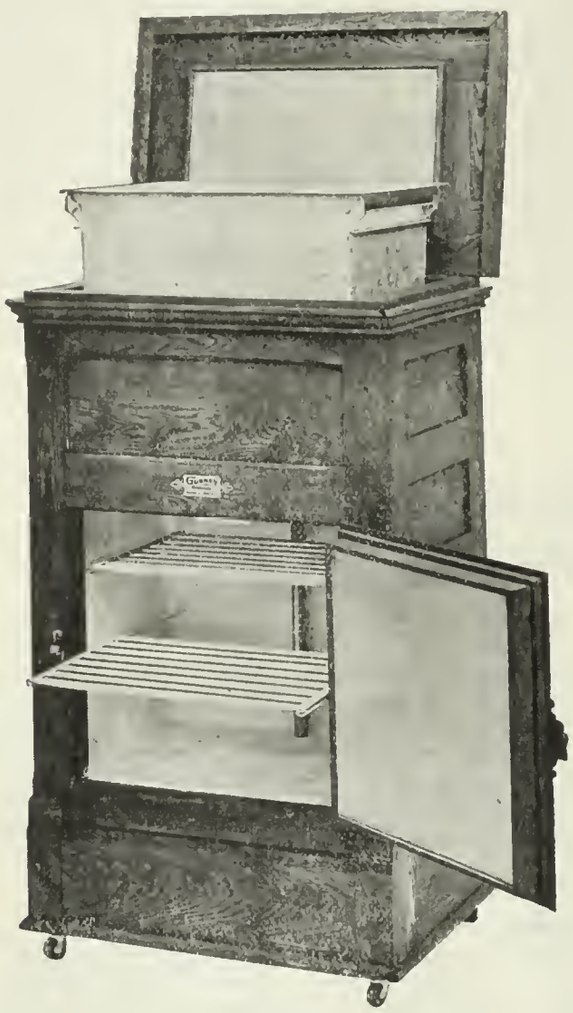
Aluminum Paint.

The Sherwin-Williams Company, 100 Canal street, Cleveland, Ohio, are distributing samples on tin of their aluminum paint for engines, radiators, steam pipes, heater pipes, architectural iron work, &c. The company state that when aluminum paints were first introduced they were not satisfied that the nature of such goods, as then manufactured, would warrant them in placing an aluminum paint on the market. At the same time they saw the value there would be in a properly made aluminum paint, and as the result of experience and study, they claim to have produced a paint that has none of the objections found in others. In a circular referring to the merits of this paint the company say that those who have had experience with other aluminum paints have found that the bronze sets hard and cannot be easily stirred, that the brilliant luster is lacking and that discoloration soon sets in; also that the paint cracks and blisters under the action of heat and cold, and moreover that it has a nauseating odor. The Sherwin-Williams aluminum paint, they claim, has none of these faults, while it has distinct merits of its own. It is said to be a perfect protection for all metal surfaces and to be unaffected by moisture, extreme heat or cold, and will not discolor under the action of lubricating oils or grease. It is claimed to possess great covering capacity and remarkable durability, and to work easily with good drying qualities, withal being as bright as silver.

The Star Meat Tenderer.

The accompanying illustration represents a meat tenderer offered by the Parker Wire Goods Company, Worcester, Mass. The tenderer consists of eight seven-pointed stars, stamped from sheet steel. These are fastened rigidly on a cylinder, with washers between each star. Each point of the stars has its edges dished outwardly from the cylinder. When it is necessary to sharpen, a small flat file may be drawn to and fro against the outward edge of each star, bringing them to a keen cutting edge. In running the tenderer over the meat the cylinder turns, carrying all the stars with it. The manufacturers state that when thoroughly used it never fails to render otherwise tough meat very tender, more palatable and easily masticated, by cutting and separating the fibrous tissues and tendons, which causes toughness in ordinary meats. It is further explained that although highly successful in all cases, the tenderer is especially so with round and rump steaks. The device is designed to retail at 25 cents.

The Star Meat Tenderer.



Display of American Goods in England.

One of the fine showrooms of American goods in England is at 124 Holborn, London, E. C. Holborn is one of the two great thoroughfares of London, which lead from the fashionable West End into the heart of the metropolis. On entering the showroom the eye of the visitor is arrested by the handsome display of chafing dishes and tea kettles. Arranged along one side are showcases containing a great variety of mechanics' tools, saws, files, hammers, axes, planes, drills, &c. The right wing is devoted to lamps and oil stoves. In the center of the room is a fine display of refrigerators, carpet sweepers, wringers, washing machines, &c. Lawn mowers and agricultural tools are arranged on the other side of the building. It is the intention of the proprietors to make their showrooms headquarters in England for the display of American inventions and productions of merit.

The founder of this business is John G. Rollins, a pioneer in American business in England, he establishing himself in London in 1866. In 1897 Mr. Rollins was joined by his sons, John G. Rollins, Jr., and Warren D. Rollins, and the firm's name was changed to John G. Rollins & Sons. The English business is under the management of Warren D. Rollins, who makes his residence in that country. The house are well known in the Colonies, and are shipping American goods to almost every country on the globe. The other offices are at 15-25 Whitehall street, New York, and 12 Lancelots Hey, Liverpool.

The Gurney Refrigerator.

Herewith is given an illustration of the improved Gurney lift out ice tank refrigerator made by Gurney & Co., Boston, Mass. The leading feature of this refrigerator, as its name indicates, is the removable ice tank, which construction, the manufacturers claim, gives 20 per cent. more ice capacity than other constructions, while showing from 4 to 6 degrees lower temperature in 30 minutes. The ice tank is made of galvanized iron, with turned edges and riveted joints. It has a center cold air discharge and the ends form complete flues, with circulation measuring 550 feet, anemometer test. The refrigerator is substantially built of hard Northern white ash finished in golden oak with spar varnish. It is made on the most modern theory of insulation, with an

The Gurney Refrigerator.

inside wall of zinc, then a heavy wall of matched lumber and a wall of charcoal sheathing, then a dead air space and another wall of charcoal sheathing. The shelves are made to slide, leaving space at the ends, giving flue circulation, and are all turned, doing away with sharp edges. The drip pan, a new invention, is inserted and will not condense; the drip pipe is removable, with screw air tight joint, and the drip cup is automatic, with gravity action. The hardware is the company's own make, of solid, heavy brass, and the lid holder is automatic. The refrigerator can be readily cleaned in all parts. It is made in four sizes, to accommodate 45, 63, 90 and 106 pounds of ice respectively.

In a special illustrated article the *Sentinel-Leader* of Warren, Ill., gives a glowing description of the factory and management of the Elliott Mfg. Company of that town. The company started a little over two years ago with a capital stock of $20,000 to manufacture the Elliott Anti-Rusting Tinware, and the enterprise has achieved a marked success. They are planning to begin a large extension of their plant in the early spring. The officers of the concern are: W. F. Conyne, president; Joseph Appel, vice-president; J. A. Brooks, secretary and general manager, and James Bayne, treasurer.

Stove and Hardware Dealers.

A. B. Hendryx, New Haven, Conn., has issued a new catalogue showing his Bird Cages and Metal Specialties.

The Safety-Bright-Light Mfg. Company, 520 Franklin street, Peoria, Ill., are distributing a circular in folder form descriptive of their Safety-Bright-Light Gasoline Gas Lamps. The main feature of these Lamps is the improved generator and packing. The claim is made that these Lamps are perfectly safe, because the gasoline is not confined in any way nor is extra pressure used. The Lamps are included among the devices permitted by the National Board of Fire Underwriters. The Lamps are constructed of highly polished brass and are warranted for one year as to workmanship and material. They are manufactured in several designs for use in homes, large buildings, or the open air.

H. E. Sturtevant has secured the New York agency of the Wagner Mfg. Company of Sydney, Ohio, makers of high grade Cast Iron and Aluminum Hollow Ware. Mr. Sturtevant's headquarters will be with the Neal & Brincker Company, 18 Warren street, New York, where he will carry a line of samples and a stock of staple goods.

The fire which recently destroyed the plant of the Standard Oil Can Company, Toledo, Ohio, caused a serious interruption to their business, which has now, however, been overcome by the removal of the company to a new plant on Bancroft street, from which they are now shipping their product.

Baldwin & Wilson have bought out the Hardware, Stove, Sporting Goods and Building Material business formerly conducted by Acker & Cole, Fayette, Ohio, and will continue at the old stand.

W. A. Kehnast, Defiance, Ohio, who has been in the Hardware and Stove business at that point since April 1, 1870, has taken into partnership two of his oldest clerks, Abraham Smith, who has been identified with the business for 14 years, and Henry Roehrs, who has been connected with it for a period of 12 years. Mr. Kehnast alludes to this action as in the nature of a reward for faithful service. The new style of the concern will be the W. A. Kehnast Company.

O. Lindemann & Co., 81 Beekman street, New York, are sending out a catalogue of 42 pages, showing their line of Japanned, Brass and Tinned Wire Cages, also a full line of Cage Sundries.

Bayside Mercantile Company, Bayside, Borough of Queens, New York City, will value catalogues, price-lists and quotations relating to Hardware, Oils, Paints, House Furnishings, &c.

Swinton & Co., Port Jervis, N. Y., request catalogues, price-lists, &c., relating to novelties in Hardware Specialties, Wooden Ware and House Furnishing Goods.

Barbour Hardware Company, dealers in Hardware, Stoves, Furnaces, &c., East St. Louis, Ill., have increased their capital stock to $20,000.

Several months since Hughes & Curtiss, Downer's Grove, Ill., opened a branch store at Naperville, where they are carrying a large and varied stock, embracing Heavy and Shelf Hardware, Tinware, Farming Tools and Implements, Wooden Ware, Paints, Oils, Wagons, Buggies, Carriages, &c.

C. F. Luthy, Millersburg, Ohio, has disposed of his stock of Hardware, Stoves and Agricultural Implements to Lemon, Kreiger & Miller, who took possession on the 7th ult. Mr. Luthy has been engaged continuously in the Hardware business for 35 years with the exception of the period 1898-1900, during which time he was identified with the wholesale notion house of the Stuber, Luthy & Gregg Company. Mr. Luthy has not yet decided what business he will take up, but has several things in prospect.

Rouse & Byram, Abingdon, Ill., have been succeeded by Main & Byram, who will continue the sale of Shelf Hardware, Stoves, Tinware and Farming Implements.

Voss Bros. Mfg. Company, Davenport, Iowa, manufacturers of the Ocean Wave Washing Machine, have just let a contract for another building, which will double their capacity. This makes the third addition to their factory within the last six months and shows the growing popularity of their Washer. The company are over 400 Machines behind their orders and are kept busy apologizing for the delay in shipments, and asking the trade to bear with them for a short time until they get in shape to ship more promptly.

The Baltimore Stencil & Mfg. Company of Baltimore, Md., have erected a two-story building, 80 x 200 feet, on Bush street, in which they are installing machinery for the manufacture of Galvanized and Japanned Ware, &c. Frank Guldener is president of the concern, J. R. Karle, vice-president, and Ernest Sharp, secretary.

Tracy & Robinson, dealers in Hardware on Asylum street, Hartford, Conn., have recently taken W. D. Williams into partnership. The name of the new firm will hereafter be Tracy, Robinson & Williams.

The early buyers are now placing their orders for Ice Cream Freezers, Ice Crushers and similar goods, and with a view to securing their interest the North Brothers Mfg. Company of Philadelphia, Pa., are sending out a new 24-page catalogue on buff paper, in a blue cover, devoted to their Lightning, Gem, Blizzard and Crown Ice Cream Freezers. The Lightning Freezers are made in large sizes, to be operated by power. The catalogue shows a variety of Packing Tubs and Packing Cans, besides the Rapid Ice Breaker, to be operated by power, and the Lightning, Gem and Crown Ice Chippers and Shavers.

The officers of the Iowa Retail Hardware Dealers' Association have changed the headquarters for their Des Moines meeting, February 18-20, from the Savery to the Kirkwood Hotel. The programme of this meeting was given in our last issue.

Rummel & Wright, Iowa Falls, Iowa, have disposed of their Hardware, Stove, Agricultural Implement and Sporting Goods business.

Under date of January 22 the Cincinnati Pump Company announce that they have purchased the entire plant of the Bucket Pump Company, and with additional machinery are now in a position to execute orders more promptly and advantageously. The works have recently been moved to Liberty and Clay streets.

The New Jersey Aluminum Company, Newark, N. J., have just issued their catalogue for 1902, showing their line of fancy articles and specialties in Aluminum which they are now manufacturing. The catalogue consists of 32 pages, well printed and illustrated, and bound in a brown paper cover, printed in bronze and aluminum.

The Berger Mfg. Company, Canton, Ohio, are sending out a small pamphlet, with the title "Light *vs.* Darkness," in the interests of their line of Lanterns. Illustrations are given of a number of styles of Hand Tubular Lanterns, also Lanterns for dashboards, railroads and side walls, with Hanging Lamps, Tubular Globe Street Lamps and Tubular Headlights. Reference is also made to the company's Crystal Valve Oil Can, made of heavy crystal glass and protected against explosion or fracture by strong wire guards.

W. H. Millspaugh has purchased the stock and fixtures of Coe & Timerman at Oneida, N. Y., and will hereafter carry on his retail Stove business in the store lately occupied by that firm.

H. A. Currier has sold out his retail Stove and Hardware business to L. J. Currier and E. A. Jones.

Frank E. Sherman has bought from I. P. Haynes the building and stock and good will of the Bar Harbor Stove Company, retail dealers in Hardware, Stoves, &c., at Bar Harbor, Maine. Mr. Haynes was compelled to give up business owing to ill health.

W. A. Sherman, 309 River street, Troy, N. Y., is preparing to make a special display of Stoves, House Furnishing Goods, Tinware, Refrigerators, &c., during the week of February 17-22, which all Troy merchants will make a gala week, it being the time of the holding of Troy's Industrial and Mercantile Exposition.

James U. Pomeroy, secretary of the Rochester Lamp Company, died on January 19 of diabetes, aged 32 years. He was born in Rochester, N. Y., and at an early age entered the employ of his uncle, Charles S. Upton, proprietor of the Rochester Lamp Company. On Mr. Upton's death Mr. Pomeroy became president of the concern. Two years ago his health began to fail, and he resigned the presidency in favor of Frank C. Jones and took the office of secretary.

Gardner & Hughes, Lancaster, Ohio, are moving their retail Stove and Tin store into larger quarters. When the removal is completed the firm will have one of the most conveniently arranged and best equipped plants of the kind in Ohio.

A. M. Smith, dealer in Hardware, Stoves, Agricultural Implements, Sporting Goods, &c., Chapman, Neb., has disposed of his business to John McCormick.

C. M. Moore is successor to Barnes & Moore in the Hardware, Stove and Sporting Goods business in Comanche, Texas.

MacLennan & Nelson are successors to MacLennan & Graham in the Hardware and Stove business in Bemidji, Minn. The firm do both a wholesale and retail business and have recently taken possession of new quarters.

M. J. Finch has sold out his Hardware store in Hawarden, Iowa, to W. H. Wilkinson, who continues at the old stand. Mr. Wilkinson's line embraces Hardware, Stoves and Tinware, Plumbing, &c. He has added considerable new stock.

W. J. Meyer has succeeded Covell & Son, Idana, Kan., dealers in Shelf and Heavy Hardware, Stoves, Tinware, Harness, &c.

A. C. Rickly & Co., who lately embarked in the Hardware, Stove, Tinware, Farm Implement and Sporting Goods business in Hobart, O. T., are expecting soon to erect an addition to their store in view of the growth of their trade.

Rouch Bros. have opened up in business at Dover, O. T., handling Shelf and Heavy Hardware, Stoves and Tinware, Farming Implements, Sporting Goods, &c. They occupy a new brick building erected especially for their business.

The Orange Hardware Company, Orange, Va., on November 18 last disposed of their entire stock of Hardware, Building Material, Stoves, Agricultural Implements, Vehicles and Harness to the Greiner-Ricketts Hardware Company, who continue at the old stand.

Charles Reisinger, for several years with the James C. Lindsay Hardware Company, Pittsburgh, Pa., has bought out the Hardware business of Frazier & Smith, 1236 Liberty street, Franklin, Pa. Mr. Reisinger is putting in a new metallic ceiling and new showcases, and making other improvements. He will carry a full retail stock of Hardware and also job plumbing goods. The business will be conducted under the style of Franklin Hardware Company.

B. S. Prunty has succeeded Prunty & Iseninger in the Hardware, Stove and furniture business at Grimes, Iowa.

The Household Mfg. Company, manufacturers of Tin Kitchen Ware, 82 North street, Boston, Mass., were visited on January 24 by a fire which damaged their factory.

According to the *Railroad Gazette* the total output of the eight locomotive building companies of the country, representing 15 plants, for the year 1901 was 3384. This is 231, or 7.3 per cent., more than in 1900, and the record. The output from 1890 to 1900 follows: 1890, 2240; 1891, 2865; 1892, 2012; 1893, 2011; 1894, 695; 1895, 1101; 1896, 1175; 1897, 1251; 1898, 1875; 1899, 2473; 1900, 3153. Less than 10 per cent. of the locomotives built last year were for export, as against about 16 per cent. in 1900.

According to statistics collected by the Census Bureau the gross value of the products of manufacture in the United States in 1900 was $13,008,127,682, as compared with $9,372,437,282 in 1890, an increase of 38.73 per cent.

Friedley & Voshardt's Metal Ceilings.

Some very attractive as well as extensive work in metal ceilings has recently been put in place in Memphis, Tenn., by Friedley & Voshardt, 194 to 202 Mather street, Chicago. The employment of this Chicago firm for the erection of these ceilings at such a distant point is a high tribute to the excellence of the work, the character of the designs and the reputation of the firm. Illustrations are herewith given of the work thus done. Fig. 1 shows a ceiling placed in the Hunter Building, in which a large surface was covered by one of the firm's finest designs. Fig. 2 shows the ceiling placed in the Napoleon Hill Building. In this building 600 squares were used, as well as 2 miles of beam molding. These ceilings are constructed of Nos. 28 and 29 soft steel sheets connected by the firm's patent joints. They make a great variety of designs for steel ceilings, which are illustrated in a large catalogue which they have quite recently issued, showing not only borders, panels and other parts of ceilings, but also a great deal of other work in sheet metal ornaments.

Friedley & Voshardt's Metal Ceilings.—Fig. 1.—A Ceiling in the Hunter Building, Memphis, Tenn.

Fig. 2.—A Ceiling in the Napoleon Hill Building.

Artistic Sheet Metal Stamping.

We made mention recently in these columns of the completion of the plant of the Laughlin Nail Company, Martin's Ferry, Ohio, for the production of black sheets for use in their corrugating, galvanizing and metal ceiling works. Herewith we are enabled to illustrate an example of their stamped work in sheet metal which suggests very strikingly the possibility of sheet steel as a medium of artistic expression. These two pieces are each 18 x 48 inches in size and were stamped from 28-gauge Bessemer sheets, rolled and annealed at the Laughlin sheet mills, for the use of their ceiling department. The method of applying these plates is novel and effective. The pieces are provided with an extra or a double bead on two sides of the plate, the outer one being of such size as will nest within the bead of the next adjoining plate, concealing the raw edge of the sheet perfectly and rendering it entirely unnecessary to swedge the joints. Only enough nailing is required to hold the pieces in place, as the joints are stiff enough to retain their position without nailing them tight. Experienced workmen, the company say, claim to be able to erect double the quantity of this metal over the old single bead styles in a given time. This feature of the company's products will undoubtedly prove attractive to ceiling men. The company employ a corps of competent draftsmen and are prepared to furnish drawings and estimates promptly. They are preparing a catalogue of their products in this line and pending its completion they are ready to execute orders, sending photographs with their estimates.

Artistic Sheet Metal Stamping.

Interior Decoration in Metals.

"One of the most notable tendencies in interior decoration just now," said an architect, "is to introduce the metals, especially copper, to take the place of wood and plaster. Closet doors, panels, jambs between ranges of small windows, ceilings and cornices are more and more being made of copper and compositions in which copper is used and, with the constantly increasing means of cheap production and working of metals, this practice is likely to be extended still further.

"Frequently now metal is being used as the outer casing for wood work, and the result is both original and highly decorative. Besides this the metals are used in grilles in and about fire places and in moldings to inclose marble and tile linings.

"The extension of the electric light first created a demand for light hand wrought fittings in metal, and from that the use of that material extended quickly to fire screens, stands, trays, flower and lamp standards and to all the 101 small objects that crowd the modern drawing room. From these to the room itself was an easy transition.

"But the demand that everything about a modern high class dwelling shall be fire proof as far as pos-

sible is a factor which has helped to push metal work along to take the place of wood. The time is coming when the use of the latter will be reduced to a minimum in a fine house."

FLUTED CAKE PANS.

A perspective view of a round fluted cake pan is shown in Fig. 1. This may be made of IX tin, using the small beading machine and round pliers. Assuming that a round pan is desired, with a 10-inch bottom diameter and 1-inch high flutes, as shown in Fig. 2, then set the compass to 5-inch radius and, with A in Fig. 3

Fig. 1.

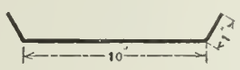


Fig. 2.

as center, describe the circle B; add 1 inch for the flute and describe the circle C.

Using the small beading machine, turn a bead of the smallest roll on the circle B, when it will look as shown by *e* in the small diagram in Fig. 3. Then, using the pointed or round pliers, turn the outer 1-inch edge upward in the direction of the arrow *f*, at the same time turning one corrugation right, then the other left, continuing in this manner in the same corrugation a number of times around the outer 1-inch edge until the proper flare has been obtained as shown in Fig. 2, the corrugations looking as shown in the perspective view, Fig. 1.

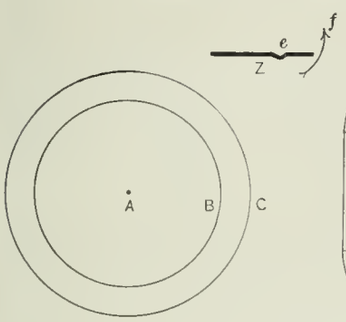

Fig. 3.

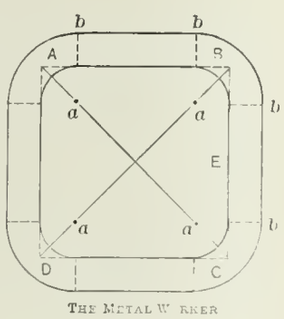

Fig. 4.

A SQUARE PAN.

If a square pan is desired with rounded corners proceed as shown in Fig. 4, where A B C D shows a 10-inch square. Draw the diagonals A C and B D; then, with the desired radius and *a*, *a*, *a*, *a* on the diagonal as centers, describe the quarter circles shown. Add the distance of the flare, as shown, and strike the outer arcs. Then, using the small beader, turn a bead on the line E. The crimps or corrugations only take place on the rounded corners *b*, *b*, &c., the flare on the straight portions being entirely flat.

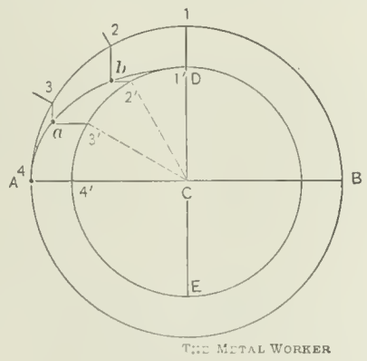

Fig. 5.

AN ELLIPTICAL PAN.

Should occasion arise that an elliptical pan is desired, the method of turning the flare is the same as above described, but the blank for the elliptical pan is obtained as follows: In Fig. 5 draw any line, as A B, representing the length of the pan, and D E, the width of the pan. With C as center describe the circles A B and D E. Divide the quarter outer circle into equal spaces, as shown, from 1 to 4. From these points draw radial lines to C, intersecting the inner circle at 1', 2', 3' and 4'. From the intersections on the outer circle draw vertical lines and from the intersections on the inner circle horizontal lines, similar lines intersecting each other at 4, *a*, *b* and 1', through which draw the quarter elliptical curve. Trace this curve between each of the quarter circles and the result will be a true ellipse, to which the flare of the pan must be added.

SHORT RULE FOR PITCHED COVER WITHOUT ALLOWANCE FOR LAPS.

In the accompanying illustration is shown a short rule for obtaining the pattern for round pitched covers of any diameter or hight. Supposing a pitched cover is

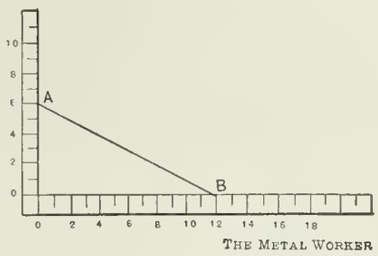

Fig. 1.—*Obtaining Radius from Steel Square.*

desired 24 inches in diameter and 6 inches high and the pattern is to be laid off directly onto the metal without the use of any drawing. Then proceed as is shown in Fig. 1, which gives a diagram of a steel square with the various dimensions on same. Now place one point of the compass on 6 on one arm of the square, which represents the hight, and the other point on 12, representing the half diameter; then will this distance, A B, be the radius with which to strike the pattern. Now with any point, as A in Fig. 2, as center, describe the arc B B¹. Multiply the diameter 24 by 3 1-7, which will equal 75 3-7 inches, the circumference of the 24-inch circle. Divide by 2 for the half pattern, which leaves

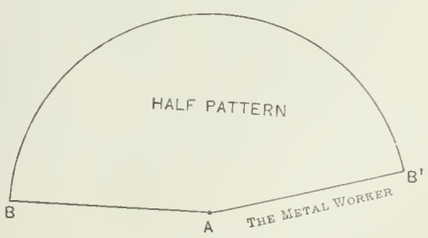

Fig. 2.—*One-Half Pattern.*

37 5-7 inches. Set the dividers 1 inch distant, and step off 37 1-inch spaces on the arc B B¹, starting from B. Divide the inch division on the rule into seven equal spaces and add five of these spaces on the arc B B¹. Draw a line from A to B and A to B¹, which will complete the one-half pattern for the cover.

ACTIVE work has been started on the ten-mill Sheet plant to be built by the Rolling Mill Company of America at South Connellsville, Pa. It will be recalled that George J Mumbert, who was manager for some years of the Connellsville works of the American Tin Plate Company, is identified with this concern. It is possible that later on a blast furnace and an Open Hearth Steel plant may be built, in order to give the concern their own supply of Steel.

The Youngstown Iron & Steel Roofing Company.

The new sheet mills of the Youngstown Iron & Steel Roofing Company, which were started up in September, are running very satisfactorily. The concern are manufacturers of both black and galvanized sheets in iron and steel, iron and steel roofing and siding, Youngstown corrugated expanded metal lath, trough bridge flooring, fire proof flooring and other specialties. Rolling their own sheets for the manufacture of these goods, the concern are able to guarantee quality. C. A. Cochran has recently been appointed secretary of the company. L. E. Cochran, who has been in the iron business in the Mahoning Valley for many years, is president; G. M. McKelvey, vice-president; Mason Evans, treasurer, and John O. Pew, general manager. The concern maintain branch offices in Philadelphia and also in the Park Building, Pittsburgh, the latter office being in charge of L. E. Aber.

The American Rolling Mill Company.

The American Rolling Mill Company, whose general offices are in the Rookery Building, Chicago, have purchased the rolling mill at Sandwich, Ill., which has been idle for some time. This plant has a 9-inch finishing train of rolls and an 18-inch three-high muck mill. Within a few weeks the company will arrange for a 16-inch train of finishing rolls and will also build eight double busheling and puddling furnaces. These improvements will place the works in good condition and will enable the company to considerably increase their production of bar iron. They are further starting their basic open hearth steel furnace at Muskegon, Mich., and will begin to roll billets in a few days. Another open hearth furnace will shortly be built at this plant, which will more than double its steel capacity. They will need most of the billets produced here for their own use.

Sheet Metal Workmen's Wages.

Arrangements have been made which promise to bring about more amicable relations between the sheet metal factories of Chicago and the workmen employed in them. Committees from the Sheet Metal Contractors' Association and the Sheet Metal Workmen's Union met on the 23d inst. and organized a joint arbitration board, to which will be referred all disputes regarding the scale of wages, hours of labor and apprentices. Johnston McIlroy of the McIlroy Cornice Company was chosen chairman, C. D. Wheeler of the Sheet Metal Workmen's Union secretary and Harry C. Knisely of the employers' association treasurer. The arbitration board will consist of 11 members, of whom five will be chosen from the employers and five from the workmen. The other member of the board will be chosen from a list of six names, which have been submitted to the board. This eleventh man will be called in to act in case of a tie vote on any proposition on which a majority cannot agree. It also was decided that the recent wage scale agreed upon is to date from January 11. The action taken is very important, as peace is thus assured in a branch of trade which has been much disturbed by labor troubles.

Dinner to Eugene W. Pargny

The Inn, at Vandergrift, Pa., was the scene, on Friday evening, January 24, of a dinner given to Manager Eugene W. Pargny of the American Sheet Steel Company, in honor of his return from Europe after an absence of three months. The affair was planned as a little surprise by Mr. Pargny's friends of the Vandergrift-Apollo unit, and was attended by the heads of all the departments of those works, which included the mills at Vandergrift, Apollo, Leechburg, Hyde Park and Saltsburg, which mills are all under the direct management of Mr. Pargny, with S. Arch Davis as division superintendent. The latter, as master of ceremonies, made the address of welcome, calling forth a very nice response from Mr. Pargny, after which each one present made a few remarks, assuring the manager of their continued hearty support in striving to maintain the high position their works hold as a part of both the American Sheet Steel Company and the United States Steel Corporation. Among the guests from out of town were P. F. Smith, manager of Woods and Wellsville works; S. B. Ely, chief engineer, and R. A. McKinney, purchasing agent.

Bruce & Cook.

The following circular issued by the well-known and old-established tin plate and metal house of Bruce & Cook, New York City, under date of February 1, 1902, will be of wide interest to the trade:

"The partnership heretofore existing under the firm name of Bruce & Cook and doing business at 190 Water street, New York, has this day been dissolved by mutual consent. All debts and accounts owing to or from said firm will be liquidated at the office of the firm at the above address.

(Signed) "Russell W. McKee, Spencer A. Jennings, Philander R. Jennings, Frank C. Jennings, A. Gardiner Cooper, Elsey C. Cook and Estate of I. R. Bruce."

"The undersigned have this day entered into a copartnership under the firm name of Bruce & Cook, and will continue the business heretofore carried on under the same name at 190 Water street, New York City.

(Signed) "Spencer A. Jennings, Philander R. Jennings, Frank C. Jennings and A. Gardiner Cooper."

FLASHINGS.

The American Rolling Mill Corporation, who reorganized at the beginning of the year and increased their capital stock to $1,000,000, have elected the following officers: President, L. C. Straight; secretary, F. W. Peck, Jr.; general manager, W. I. Moody. The following are directors: F. W. Peck, Sr.; John S. Cooper, W. I. Moody, John H. Palmer and C. I. Peck. The company operate mills at Muncie, Ind., Muskegon, Mich., and Sandwich, Ill.

Frederick M. Strong has resigned as manager of the Elwood, Ind., plant of the American Tin Plate Company to become the head of a new company who will erect an independent Tin Plate plant at Greencastle, Ind.

The Metal Ware Selling Company have been incorporated under New Jersey laws, with a capital stock of $250,000, to manufacture Galvanized Iron and other Metal Ware. The incorporators are Gordon Gordon, William S. Whitman, Franklin Griggs, Frederick L. McAfee and J. Bailey.

The Budke Iron & Mfg. Company, now being organized by Senator Budke of Canonsburg, Pa., and others, with a capital of $800,000, propose to erect a plant near Shannopin Station, on the Pittsburgh & Lake Erie Railroad, for the manufacture of Sheet Iron and Steel. Ground at the above named location has been secured, and as soon as the company are thoroughly organized preparations will be made for the erection of the works.

A meeting of the stockholders of the Youngstown Iron, Sheet & Tube Company was held in Youngstown, Ohio, on January 23, and the capital stock of the company was increased from $2,000,000 to $4,000,000. An increase was made in the Board of Directors, H. C. Dalton of Pickands, Mather & Co. of Cleveland and James Parmlee, also of Cleveland, being added. S. V. Hubner & Co., consulting engineers, of Pittsburgh are drawing plans for the open hearth plant to be built by this concern, and which will also comprise a blast furnace to supply metal. The puddling department of the Youngstown Iron, Sheet & Tube Company has been started, making Iron from which Iron Sheets will be rolled for covering their own buildings.

Two mills of the Sheet plant of the Maryland Sheet & Steel Company, Cumberland, Md., have been placed in operation. The 32-inch mill will be placed in operation shortly. The open hearth furnace in the plant which has been enlarged to 20 tons capacity, will be started about February 15. The blooming mill will also be placed in operation about that time, and the Sheet Bars required

will be rolled from the Steel made in the open hearth furnace. The mills are equipped to roll Sheets from 10 to 18 gauge. The five steam hammers in the plant will also be started soon.

The directors of the Parkersburg Iron & Steel Company of Pittsburgh, whose Sheet mills are located in Parkersburg, W. Va., met there last week and elected the following officers: H. H. Neiman, president; A. H. Geilfuss, secretary; John F. Budke, vice-president and general manager; H. S. Duncan, vice-president and business, manager; L. A. Myvel, treasurer; A. E. Neiman, assistant treasurer. The directors are G. Succop, Captain W. H. Geilfuss, W. H. Paxton, Charles Geilfuss, Frank W. Budke, and A. P. Flowers, all of Pittsburgh.

It is expected that the buildings at Hammond, Ind., formerly used by the Corning Steel Company for the manufacture of Sheets will be utilized for the building of cars. This property was purchased about two years since by the American Sheet Steel Company, who dismantled the works last summer and removed the machinery to their other plants. They have recently disposed of the ground and buildings to Torbert & Beckham, Monadnock Building, Chicago.

Broderick & Quinlin, boiler makers and sheet iron workers, Montpelier, Ind., have incorporated their business under style of Broderick & Quinlan Mfg. Company. They have during the past four months enlarged their plant and installed new machinery.

The Stark Rolling Mill Company, Canton, Ohio, have decided to add two more hot mills to the four now in operation. They are at work on a new brick and steel warehouse 200 x 50 feet.

Goff, Horner & Co., Limited, Pittsburgh, have acquired an interest in the property of the Curtis Sheet Steel & Corrugating Company of Zanesville, Ohio, and at the same time have arranged that all the buying and selling of materials for the company shall be conducted through their offices at Pittsburgh. All contracts for both raw and finished material have been assumed and will be executed by Goff, Horner & Co., to whom all inquiries for the product of the mills should be sent. Black and Corrugated Sheets are now being manufactured and a galvanizing department is almost completed. Four mills are now in operation and another one will probably be added at once, when the plant will have an output of 1250 to 1500 tons per month of Black, Corrugated, Galvanized and fine grade Pickled and Cold Rolled Sheets.

A small catalogue has been received from the E. W. Bliss Company of Brooklyn, N. Y., dealing with their Presses, Dies, Shears and Special Machinery. While having a very complete line of standard machines, the company make a specialty of designing and manufacturing machinery for special purposes.

In addition to the plant now under construction the Carnahan Stamping & Enameling Company, Canton, Ohio, will erect a galvanizing department, contracts for which have just been let. The plant will be in full operation about March 1.

The Juniata Tin Plate Company, capitalized at $250,000, will build a Black Plate mill and Tin Plate factory at Greencastle, Ind. F. M. Strong, for several years manager of the Elwood plant of the American Tin Plate Company, has resigned that position to take charge of the new company. Associated with him are Samuel Lewis, William H. Richards, J. H. Seiberling and H. M. Strong.

Work on the new Tin Plate plant of the McKeesport Mfg. Company, at Port Vue, near McKeesport, Pa., will shortly be started. The equipment of the plant will be of the most modern description. It will embrace ten mills, with a capacity of from 35,000 to 40,000 boxes of Tin Plate per month. The plant will be reached by the Pittsburgh & Lake Erie and the Baltimore & Ohio railroads, and it is expected that the company will be ready to ship their products late in the coming summer. The stockholders of the concern are: E. P. Douglass, J. C. Smith, Dr. J. W. Fawcett, Dr. E. T. Nason, G. F. Meyer, R. T. Carothers, E. R. Crawford, J. E. Lauck and E. W. Pitts of McKeesport and William Curry of Pittsburgh. Mr. Crawford will be general manager and Mr. Lauck superintendent.

Although the quantity of Tin Plates exported from the United States is still comparatively small, the exports in the calendar year 1901 showed a material increase over those of the preceding year, being, in 1900, 612,251 pounds and in 1901, 983,383 pounds, a growth of nearly 60 per cent.

The examination of the sales sheets of the American Sheet Steel Company for the 60 days ended December 31, 1901, to determine the wage rate for Sheet Steel workers for the months of January and February, 1902, showed that no advance in wages was due the workers for those months.

The total exports of Tin and Terne Plates from Great Britain to the United States in the 12 months ended December 31, 1901, amounted, according to the official returns of the British Board of Trade, to 75,819 tons, as compared with 58,043 tons in the calendar year 1900. This is the first year in which an increase in the shipments of Welsh Tin Plates to this country has occurred since the coming into effect of the McKinley tariff in 1891. The growth was obviously due to the scarcity of domestic Tin Plates, caused by the prolonged strike at the American mills last summer.

George C. Hartman has opened a tin shop in the William Denkel Building, Bridgewater, Va.

W. R. Calkins & Son have opened a new tin shop in the S. McGirr Building, New Lexington, Ohio, where they are prepared to do all kinds of tin roofing, spouting and sheet iron work. They are also manufacturers of Tinware.

The Cooper Union.

The announcement was made this week that Abram S. Hewitt and Edward Cooper, with other heirs of Peter Cooper, the founder of Cooper Union of New York City, had given the handsome sum of $600,000 as an endowment fund to that institution. At the same time it was stated that Andrew Carnegie had supplemented the gift of $300,000 he made to the institution in 1899 by a second donation of like amount. Thus the Cooper Union is richer by $900,000, the income from which sum will enable the trustees to extend greatly its sphere of usefulness. In the first place the additional income thus secured will make possible the occupation of the entire seven-story brownstone structure of the Cooper Union for purposes of education. Heretofore a portion of the building has been rented in order to obtain additional funds for the work of the institution. Now all this rented space will be used for the purposes for which it was originally designed. The free evening classes in science and art will be strengthened and instruction will be provided for a greater number of students. The physical and electrical laboratories are also to be enlarged and the institution, as a whole, made as complete as possible.

The additional funds will also enable the trustees to provide for the accommodation of more day pupils. At present some 60 young men are being given special instruction on technical and mechanical lines in the day classes. This number can be largely increased. Indeed, it is remarkable that many more young men do not embrace the remarkably favorable opportunities for obtaining a free training in civil and mechanical and electrical engineering and in chemistry offered in the Cooper Union day classes with their magnificent mechanical and laboratory equipment. This is the second season of these classes, and yet the attendance on them falls considerably short of their capacity. While there are more applicants for admission to the evening classes than can be accommodated, the day classes are comparatively neglected. At present 2800 students are receiving instruction in the various classes of the Cooper Union.

What is claimed to be the largest pane of glass in the world was turned out recently at the Kokomo Plate Glass Factory, Kokomo, Ind. It was 150½ x 221½ inches, and weighed 1450 pounds finished. In the rough it weighed 2900 pounds, taking 20 men to carry it. It was successfully finished and crated and is said to be flawless.

Making Sewer Connections.

BY J. N. S.

The question is asked: Which is the best, terra cotta or extra heavy cast iron pipe, for a sewer? It is to be presumed that the question has no reference to the main sewer in the street, but to the pipe leading from the main sewer to the house for the purpose of carrying off the waste waters, &c. If that is what is meant I should say extra heavy cast iron pipe well tarred inside and out. It will last from 50 to 75 years under ground, and therefore could well be afforded by the owner should he live that long and have need to renew it. Why is it best? Because it is not easily broken and because it is made in longer lengths, therefore will not be so liable to sag. Moreover, the method of connecting will prevent the roots of trees and shrubs from working their way into it and stopping it up.

The conclusion that cast iron pipe is the best to use for a sewer at once disposes of the terra cotta pipe, whether glazed or unglazed. But I might be allowed to say that unglazed terra cotta pipe should never be used in any case. It is porous, easily broken and not so smooth as the glazed pipe; therefore it should be discarded as unsanitary and not fit to be used. The only reason why earthen pipe is used at all is because it is cheaper and a common laborer can lay it. It can be argued that the glazed terra cotta pipe will last longer under ground. But has a sewer of any great length ever been uncovered which was not stopped up and in which all the joints were found perfectly tight? The hubs crack from natural causes and leak. Besides, terra cotta is generally condemned and considered unsanitary for inside work, so, if it is not good for inside use it ought not to be considered as best for the outside.

I have seen earthen pipe broken by stones falling on it in filling in, and I have also seen where it has sagged on account of the earth being soft and spongy, with the result of the joints being broken. I have had to remove terra cotta pipe sewer connections on account of the roots of trees and shrubbery growing inside the pipe. It is wonderful how fast they will grow once they get an opening in the pipe. I have known the roots to grow for 20 and 25 feet and nearly always toward the house on account of the grade. They grow until they entirely stop up the sewer. So much for which is the best pipe to be used.

CONNECTING A HOUSE DRAIN.

The question which is the best way of connecting to a main sewer will now be considered. Should the main sewer be built of brick, the connection should be

Making Sewer Connections.—Fig. 1.—The Point at Which the House Drain Should Be Connected.

made to it near the top, as shown in Fig. 1, for the reason that the pipe will be well up out of the running water. If it was connected near the bottom the water would back up in the sewer pipe and might possibly be the means of stopping it or flooding the cellar if there was a cellar trap. But if it is a terra cotta sewer a Y connection should be put in on the lower side of the building lot, so that connection can be made to it at any time. The Y should have a slight pitch toward the house. A connection should never be made directly on the top, as it would require a very short turn in the connection and increase the difficulty of clearing with a rod in the event of a stoppage. Into this Y should be connected an eighth bend; usually 6 inches in diameter, as that is the size of the Y generally used in the main sewer. From this eighth bend the drain pipe would be run to the house. The grade would have to depend on the pitch that it might be possible to secure for the house sewer. If the house is on high ground and the drain can be given 1 or more inches to the foot, so much the better, but if it can be given only ¼ inch to the foot it will give good results, as that grade is considered sufficient fall for a sewer pipe.

CONNECTING HOUSE DRAIN TO SEWER.

Every city has its own rules and regulations as to who shall do the tapping and running of the house sewer. Some cities claim the right to carry the sewer as far as the curb line. Others carry the sewer to the point where the iron pipe comes through the front wall. Others again require that the plumber shall tap the sewer and carry the house sewer all the way to completion. But the city employs an official, called a Tap Inspector, who sees that the connection is properly made. The Board of Health then takes the matter in hand and sees that the rest of the work is carried out according to the plumbing code. To my way of thinking it would be a good thing if every city would carry the sewer branches to the curb line. Now in the event of car tracks having to be tunneled under, it makes dangerous work and gives lots of worriment to the plumber. Besides many a poor laborer has lost his life in this way. If the city had this work in charge it could provide and locate such sewer branches and every facility required to perform the work much more readily than the plumber can. A city could, with less expense, provide the lumber and the place to store all the lumber which is required for shoring up the walls of the trench, besides having in its employ men steadily engaged at this kind of work who would become so thoroughly familiar with it that it would always be done in the right way with the best workmanship. I also think that should there be a stoppage in the street it would be better for the city to have that in charge. Furthermore, it would obviate the expense of paying for permits and privileges for opening the street. However, this is only one man's opinion.

THE INTERCEPTING TRAP.

A great deal has been written on the subject of placing a trap at the front wall, some writers contending that it is an absurdity, that it is a filthy contrivance, that it retards the flow of sewerage and that it is the means of stopping up the house sewer, from the fact that it catches the grease and paper, &c. Some claim that where the trap is used a pipe should be run up to the highest point of the building from the outside to relieve the pressure of air from the sewer on the trap in stormy weather and also to help ventilate the main sewer. Others again claim that it is imperative that the main sewer should not exhaust itself through the system of plumbing in a dwelling. Therefore, the use of the intercepting trap is urged on the ground that it intercepts the sewer air or gas by the water seal in the trap. But the fact must not be lost sight of that each and every system of plumbing, no matter how well done, is in itself a small sewer.

THE FRESH AIR INLET.

Therefore, to help make the system as pure as possible, what is called a fresh air inlet must be used. It must be remembered that this pipe has a two-fold office. It both admits air and allows it to pass out, not at one and the same time, but as the case may be. Suppose that there is no water running through the system and that the piping is carried up through the roof, where the air can have free action at the top of the soil pipe vent. This will produce a draft and cause the air to move, and in order for the air to move it must have an inlet as well as an outlet, the fresh air inlet being the inlet and the soil pipe vent the outlet. It can be seen

very readily how this is produced. But, on the other hand, let it be supposed that a big rush of water is let loose down and through the pipes. Then the air which is in the pipes must go somewhere. Since it cannot escape to the sewer, on account of the water seal in the trap, it naturally passes out through the fresh air inlet, inasmuch as there is less resistance in that direction.

The fresh air inlet should never be less than 4 inches in diameter and should be run to some point distant from any window, or so that whatever smell or vitiated air that comes from it could not enter the building. It is difficult to say which is the best place to run it as conditions are not always similar. What would be the best place in one house would possibly be the worst in another. Common sense would readily determine that, but it should be above snow in winter. It should not be carried to the curb and finished with a grate; but, should circumstances compel it to be put there, on account of the house being built on the sidewalk line, it should be brought up about as high as a hitching post, and should be made of extra heavy iron pipe to prevent it from getting broken. It should also be finished with a suitable cap. It is the most absurd thing imaginable to carry a fresh air inlet to the curb line of the sidewalk, finishing it with a grate and allow it to become stopped up with filth. What good is a fresh air inlet when it is stopped up? With apologies to Sieben, I have in mind just what would be the thing for that purpose, but for the present will say nothing about it.

LOCAL REGULATIONS.

If work is done in a city where the Board of Health says "Thou shalt not put in the trap," it would be very foolish to place one in. But, on the other hand, should it be omitted in a city where it is called for it would be equally as foolish to violate the regulation. The plumber has no choice in the matter, but must simply comply with the rules and regulations as laid down. But suppose that the work is not so circumscribed and knowledge is desired as to the necessity of putting in a trap on an operation a plumber may have under way. Should the building or buildings be so situated that there can be no detriment to the health of neighbors, and where there are no windows into which the stench from the top of the pipe could enter, I believe that a plumber would be justified in omitting the trap. But, on the other hand, if these conditions were reversed I would then say by all means use the trap, as a plumber has no right to force the neighbors to take chances on their health in the interest of himself or his customers.

Should there be occasion to use the trap and fresh air inlet perhaps the sketch given in Fig. 2 would be the

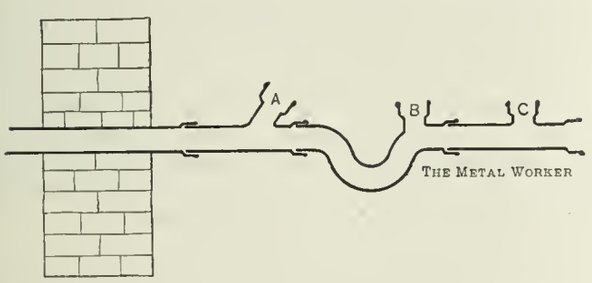

Fig. 2.—The Intercepting Trap, Fresh Air Inlet and Clean Out.

means of making clear the best way to place it. Just inside the wall place a full Y branch, A. Into this Y connect the trap with a hand hole, B. About 2 feet further on connect a tee, C. From this tee take the fresh air inlet. The Y is for the purpose of cleaning the house sewer should it get stopped up. The hand hole, B, is for cleaning the trap, and the reason for taking the fresh air inlet from tee C is that if it was taken from B in very cold weather the water in the trap might freeze from the cold currents of air passing down and over it from the fresh air inlet and so stop up the system.

PROTECTING PIPE FROM SETTLING WALLS.

If extra heavy pipe is used through the wall I don't think there will be any trouble on account of the wall sagging. Still a good plan is to take a piece of pipe larger than the drain pipe and place it in the wall and shove the drain pipe through it. Then thoroughly cement the space between them. Should the ground be of a wet nature it should be asphalted on the outside to prevent the water from working its way through.

If the system of sewerage is large enough to permit connecting the rain water leaders to it, each leader should be trapped separately at the point of connection. Otherwise the leaders will soon rust out from the gases and vapors arising in them, supposing them to be made of tin or galvanized iron. Should they be of copper or cast iron it is advisable to trap them also, for the reason that they may end near a window. If they can be connected they will help to keep the sewer clean by means of the rain water flushing through them. Be sure that the trap at the front wall has a slight fall to the sewer, not enough to affect its seal, but just enough to prevent water from standing in the pipe back of the trap on the house side, so that the greasy water will not collect in it. If this rule is followed out there will not be any trouble with the trap at the front wall.

At another time I hope to describe the various systems I have seen in different cities, how the sewers are run and how flushed, &c.

Death of Edward Baggot.

Edward Baggot, who has long been one of the leading master plumbers and gas fitters of Chicago, died January 23 at his home in that city, aged 68 years. Mr. Baggot was born in Ireland, and came to America when he was 15 years old. Shortly afterward he went to Chicago and was apprenticed to McFarland & Hutchinson to learn the plumbing trade. In 1861 he started in business on his own account and in the short space of ten years reached the distinction of being the leading contractor in that line in the West. This occurred notwithstanding the fact that for some time he neglected his business during service in the civil war as a member of Battery A from Illinois. His store was burned during the great fire of 1871, but before the fire had been completely extinguished he had a shop in operation in a barn located at Taylor street and Centre avenue. He afterward opened a shop at 132 Fifth avenue, moving subsequently to 169 and 171 Adams street, where he was located at the time of his death. Mr. Baggot was a member of the old volunteer fire department of the city. At the time of his death he was a member of the Builders and Traders' Exchange, the Builders' Club, the Chicago Master Plumbers' Association and the Sheridan Club. He leaves a widow and four sons, James E., Joseph M., John D. and George M. Baggot.

The Vance Boiler Works.

The annual meeting of the Vance Boiler Works, Geneva, N. Y., was held on January 20, and the following directors were elected: James R. Vance, B. Borgman, E. M. Winnie, W. S. Moore, J. W. Steck, George W. Goodwin and Samuel F. Myers. The directors elected the following officers: James R. Vance, president; B. Borgman, vice-president and treasurer, and E. M. Winnie, secretary. The reports of the various officers showed the affairs of the company to be in a prosperous condition, with the outlook for the coming year very promising. A new building has been erected at Torrey Park, which the company will occupy about April 1, and already some of the equipment for the new plant is being placed. As a tangible evidence of the prosperity of the concern, a dividend of 6 per cent. on the stock was declared in continuance of an annual custom.

THE plumbing establishment of W. S. Johnston, Willimantic, Conn., was visited by fire last week. The damage done was covered by insurance.

ASSOCIATION NEWS.

Pittsfield, Mass., Plumbers.

The annual meeting of the Master Plumbers' Association of Pittsfield, Mass., was held on Monday night, January 21, when the following officers were elected:

President, Daniel Farrell.

Vice-President, William Milne.

Secretary, D. W. Bovett.

It was voted to petition the City Council to amend the plumbing ordinances, especially those relating to the inspection of work.

Binghamton Master Plumbers.

The annual election of the Master Plumbers' Association of Binghamton, N. Y., was held on January 21, when the following officers were elected:

President, George Cropper.

Vice-President, F. P. Kelly.

Secretary, C. E. Boughton.

Treasurer, William Liddell.

Directors: V. W. Hadley, W. D. McCullough, A. L. Titus, John Hanley and D. J. Malane.

Cleveland Master Plumbers.

The annual meeting of the Master Plumbers' Association of Cleveland, Ohio, was held on January 21, when the following officers were elected:

President, John Leese.

Vice-President, E. H. Benhoff.

Secretary, Eb. Ellen.

Treasurer, Joseph Winterbottom.

Sergeant-at-Arms, Theodore Poplowsky.

The president has announced the following committees:

Arbitration Conference: Chas. E. Armour, A. A. Parker, A. Schneider.

Audit and Finance: Chas. Strever, Henry Mans, Frank Feller.

Entertainment: Eb. Ellen, W. J. Warden, Chas. Siefried, A. Lehman, A. J. Kobs.

Executive: E. H. Benhoff, H. Ward Daykin, Theo. Poplowsky, John Leese, Jos. Winterbottom, Eb. Ellen.

License: E. H. Benhoff, J. B. Couture, L. C. Cooper.

Price-List: East Side, H. J. Luff, Fd. R. Brewer, Theo. Poplowsky; West Side, E. K. Wolf, Richard Kohls.

Resolutions: C. C. Thomas, Horatio Sweesy, John Kelly.

Rules and Legislative: S. W. Burrows, E. E. Hill, B. M. Hallock.

Sanitary: J. B. Couture, Joe Keiper, Frank Hildebrand, R. E. Greene, C. Anderson.

Warehouse: H. Ward Daykin, D. H. Roberts, Louis Poplowsky, A. L. Baeher, Jos. Winterbottom.

Michigan Plumbers.

The master plumbers of St. Joseph and Benton Harbor, Mich., have organized an association and elected the following officers:

President, N. Wagner.

Vice-President, C. A. Taylor.

Secretary, S. T. Cruse.

Treasurer, F. Reich.

The association will meet alternately in St. Joseph and Benton Harbor.

The Best Mfg. Company of Pittsburgh have about finished a very large amount of steam fitting work for Cuba. They have had men working on this contract for several months. They received some time ago a contract for a very large amount of Steam and Gas Piping for the new open hearth steel plant of the St. Clair Steel Company, at Clairton, Pa. They also have some other large contracts and have enough work on hand to keep their large shops busy for several months. They are manufacturers of Valves, Castings, Piping, and make a specialty of Pipe Bending.

PROTECTION IN THE PLUMBING TRADE.

The following contribution on the conditions now existing in the plumbing trade is from one who has had exceptional opportunities of becoming informed on both sides of the question, and who possesses a wide range of experience covering many parts of the country:

I have read with considerable interest your various articles about protection to the plumbing trade, and now have before me your editorial of January 25, 1902. In the various communications sent you, and which you have published, very few have seemed to realize the varied conditions existing in different parts of the country. Each one has seemed, properly enough, to demand protection for himself, but has left to the devil those who follow after.

Make note from whom the bulk of the complaints come. Are they from the cities where the large operations are carried out? The small plumber in the interior town is justly entitled to all protection that can be given, but because he thinks he doesn't get protection on account of a dealer selling a greenhouse keeper a hot water boiler to heat his greenhouse, is he to hold up the entire trade of the country on account of his complaint?

There are rights and wrongs on both sides, and the greatest good to the greatest number should prevail. Allowing that one Western supply house trangressed the rules and sold a few dollars' worth of material to a stove pipe man and consumer, is that any reason why the whole plumbing trade in the country should be held up together with mutual agreements? There is one job under way in New York City at the present time that represents in dollars and cents more than is doing in some States; and is anybody kicking?

Hardwaremen, if competent to install, must have rights in localities where they have in the past been the only plumbers doing business. The writer is conversant with conditions, not only in cities, but in many small towns, where plumbing, steam fitting, tinning and roofing are allied trades, with occasionally a hardwareman doing all of the branches.

New York City Notes.

Among the sufferers from the dynamite explosion in the subway last Monday were Rossman & Braeken, who, although three blocks away and not in a direct line, had their front windows shattered.

* * *

Business is very quiet just at present in all branches of the trade. Many journeymen are out of work on account of new work not being ready and jobbing almost at a standstill.

* * *

On January 29 Morris Sandzik of 790 Second avenue, an unlicensed plumber, was convicted in the Court of Special Sessions of doing plumbing work at 681 Third avenue, on complaint of William Lockwood, clerk of the Master Plumbers' Association. Judge Mayer explained that, while counsel to the Building Department, he helped to frame the law as it stands, and Presiding Judge McKean, in fining the prisoner $25 or 15 days in the City Prison, said he was getting off easily, and that the next offender would get the full penalty.

* * *

There are a few jobs going on where men are hard at work, among them being a ten-story apartment on Eighty-first street and Riverside Drive, where the plumbing is being done by Herman Loden of 214 East Thirty-fifth street for the Moses Taylor Estate, and a ten-story apartment hotel at 124th street and Seventh avenue, to be run in connection with the Harlem Casino, the plumbing in which is being done by William Bryan of 222 East Fiftieth street.

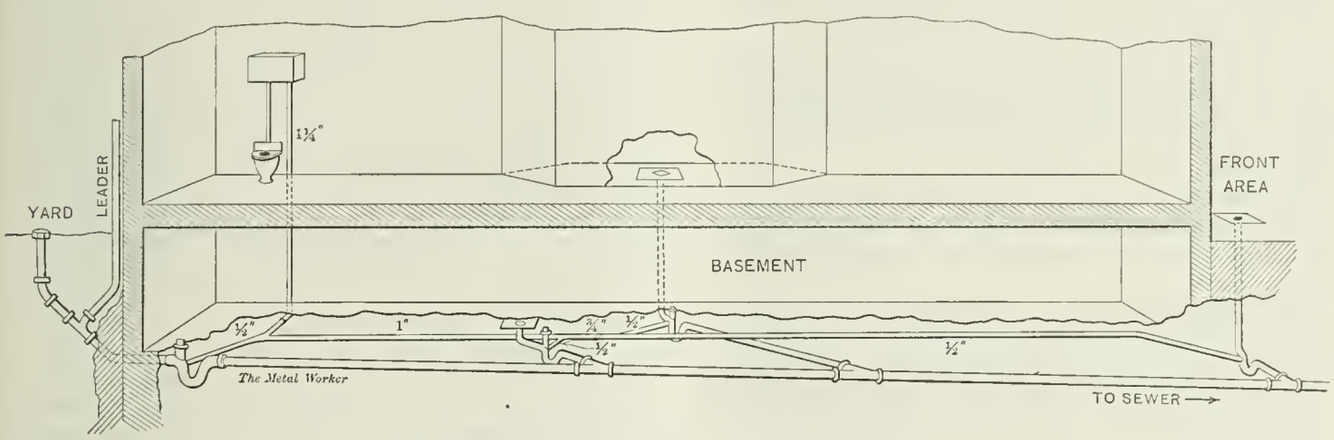
* * *

For a hustling West Side plumber Harry Spencer is getting his share of work. He is now doing apartment houses on Ninety-fourth street, between West End avenue and Riverside Drive; at Ninety-seventh street and the Drive, and in Ninety-sixth street, east of the Drive. T. F. Breen has two apartments in 130th street, west of Amsterdam avenue; L. H. Wenzel has an apartment

house at 218-220 West Eighty-fourth street, and W. J. Fowler of 2157 Seventh avenue has four apartments at Eighth avenue and 149th street.

* * *

The plumbing laws seem to be in favor with the State Legislature at Albany. Another one has been introduced, allowing a certified plumber in one city to do work in any other city of the State, except New York.



PROTECTING THE SEAL OF AREA AND CELLAR TRAPS.

BY D. F. N.

In the past few years many complaints of disagreeable odors have been made by the tenants of flats, hotels and apartment houses, and in some cases of up to date mansions. This complaint is frequently met with in the daily round of the jobbing plumber. The question is asked: "Where does that offensive odor come from? We seem to get it arising in the light shaft or when we open the door of the dumb waiter, and again sometimes when we open the rear windows." The plumber, of course, suggests the application of a smoke test to locate the defective portion of the drainage system. That is very good, but even if some defect is found and remedied it does not cure the trouble, which will soon return. The plumber, after forcing in a good pressure of smoke, finds the trap for the drain in the bottom of the light shaft has dried out, or the trap for the rear yard drain is under an indirect steam stack on the ceiling in the rear of the basement and is half sealed, emitting foul air.

In some cases the trap for the basement floor in private dwellings has evaporated from the heat of the furnace, and the sewer gas enters the basement and finds its way into the house and into the sleeping apartments above by means of the hot air conducting pipes.

The following method has been devised for overcoming this trouble from the drainage system, and the system of piping applicable to it is shown herewith: All the leaders, courtyard, front area, light shaft and floor drain traps are supplied with water to protect their seal, through the medium of a double compartment flush tank over the servants' closet in private residences, and the same kind of a tank with two corpartments over the janitor's or engineer's closet, as the case might be, in apartment houses and public buildings. One part of the closet tank does service for the closet and the other part connects with a 1¼-inch falling main pipe, having ½-inch branches, to maintain the seal in the different traps. The size of the falling main from the closet tank should be increased if more than a half dozen traps are to be supplied. The traps are drilled and tapped for ½-inch thread below the water seal. The flush and supply can be effected by means of one chain and pull on the tank or by two single levers, or a third lever can be arranged to operate the two single levers at each pull of the closet chain. One part of the tank should be reduced so as not to consume too much water, as very little is required to renew the seal of the traps. Wherever this system has been used all complaint from odors from area drains or light shafts has been stopped. It has only been used on high class buildings, but when its merits is fully appreciated it will doubtless be more widely used.

Protecting the Seal of Area and Cellar Traps.

The P. and S. S. League.

No better evidence is needed of the popularity in the trade of the bowling tournament of the Plumbing and Steam Supply League in New York than the negotiations pending to take up other contests when the present schedule is completed. Already the correspondence with the bowlers in the Boston supply trade has reached a point where the enthusiasts are looking forward to a series of games to be bowled in Boston and New York between selected teams representing the two cities. There is also a strong probability that one or more teams may be entered in a commercial league in New York City.

This week has shown improved scores. The Behrer family team won two games on Monday night, scoring 824, within three pins of the high score, Martin Behrer contributing 201. The Ronalds & Johnson Company team won and lost, W. S. Gibbs supplanting his old high score with 194. The John A. Murray team had just as much fun, if they did lose two games. On Thursday President E. E. Haff led the F. N. Du Bois & Co. team to two victories with scores of 205 and 212, the best evening's work so far in the contests. The Keating team was short one man and lost two games, while the C. S. Locke & Smith team broke even, knocking down 728 pins in one game.

The Standing of the Teams for January.

Teams.	Won.	Lost.	Team score.	Individual score.	Name.
Behrer & Co.	10	2	827	201	M. Behrer.
John Simmons Company	10	2	779	196	W. A. Presby.
Crane Company	8	2	798	210	A. E. Good.
Ronalds & Johnson Company, Brooklyn	7	3	827	198	W. T. Gilmour.
Salesmen	6	4	796	230	Henry Stein.
Central Foundry Company	6	4	701	199	J. S. Dibley.
F. N. Du Bois Company	9	5	776	212	E. E. Haff.
Dimock & Fink Company	7	5	772	194	F. Hogenauer.
C. S. Locke & Smith	5	5	728	193	C. A. Blanchard
Ronalds & Johnson Company, New York	7	7	727	194	W. S. Gibbs.
H. P. Read Lead Works	4	7	689	196	C. V. Driggs.
Fred. Adee & Co.	2	8	695	175	A. B. Kolyer.
John A. Murray	2	10	676	189	G. W. Tilton.
Thomas G. Knight	2	10	675	182	E. E. Benas.
E. F. Keating	1	11	601	185	C. J. McCarthy.

Owing to some unavoidable causes the following changes in the schedule are announced by Secretary Wilson:

Please note that the scheduled games of Thursday, January 30, between the Salesmen, John Simmons & Co. and the Central Foundry Company will be rolled on Monday, February 3. The games scheduled for February 3, between C. S. Locke & Smith, Fred. Adee & Co. and the Crane Company, are postponed and will be

rolled on some date after February 17. In place of the games scheduled for Thursday, January 30, the postponed games of Thursday, January 16, will be rolled between F. N. Du Bois & Co., Edw. F. Keating and C. S. Locke & Smith teams.

Heating and Plumbing Notes.

The State of Texas has instituted suit in the District Court at Austin against D. F. Sullivan and 20 other members of the Master Plumbers' Association of Texas for penalties aggregating $42,900,000, for alleged violations of the anti-trust law. Each of the defendants is sued for $1,950,000 in penalties. Some time ago suit was brought by Attorney-General Bell against a number of members of this association. The defendants confessed judgment, and penalties aggregating several thousand dollars were collected by the State. The defendants in the new suit are members of the association who were not included in the original suit.

The Building Department of Brooklyn, N. Y., has been visited by a delegation from the Brooklyn Master Plumbers' Association with a view to the abolition of the city regulation requiring the use of a patented fresh air inlet device. The delegation also advocated other changes that they claim will enable plumbers to make their work less expensive. Complaint was also made of the delay in the present method of passing plans and against the affidavit with notorial fees to department clerks for plans filed. The complaints and requests were heard and promise was made of investigation with a view to relief.

The Attorney-General of Michigan holds that plumbers who obtain a license from the State Board of Health for one city can pursue their calling in another city by filing such license, without taking out a new license in the second city.

The Smith & Anthony Company of Boston, Mass., bid $12,746 and secured the contract for the heating and ventilating system to be used in the High School at Watertown, N. Y.

The Board of Education of Hamilton, Ohio, will receive bids until February 21 for heating and ventilating the new 12-room school building to be erected in the First Ward in that city. Separate proposals are invited on steam, hot water, hot air and fan systems of heating and ventilating.

George Frelich, chairman of the Almshouse Committee of Schenectady, N. Y., will receive bids until February 17 for heating and ventilating the Almshouse building.

George L. Flanders & Co., plumbers and hardware dealers, of Manchester, N. H., have leased a vacant store in the Boylston Block, to which they will transfer their plumber and hardware business. In their new quarters the concern will be provided with better facilities.

Charles H. Peckham, secretary of the Board of Charities of Rhode Island, will receive bids until February 4 for heating, plumbing, gas fitting and electric wiring the new dining hall, the service and ward buildings and the boiler house at the State Hospital for the Insane, at Howard, R. I.

George J. Allen & Co. have moved into a new store at 14 Sixth street, New Bedford, Mass., where they will make a specialty of heating and plumbing, particularly of fine bathrooms.

L. E. Andrews & Co., Gloucester, Mass., have taken the store adjoining their present business establishment in order to give them increased facilities for their plumbing business.

The strike among the plumbers at Perth Amboy, N. J., has been adjusted by an agreement for an eight-hour day, to go into effect on April 1.

The Department of Public Safety, Baltimore, Md., will receive bids until February 5 for heating two school buildings, one on Walbrook avenue, and the other on Cromwell street.

Charles B. Huck, president of the New York State Association of Master Plumbers, and Secretary H. J. Wood, both of Buffalo, were in Elmira last week making arrangements for the annual convention, to be held in that city March 10-12.

Kelly, Thornton & Williams of Norfolk, Va., bid $9872 and secured the contract for plumbing and heating the new prison in that city.

Prof. S. H. Woodbridge of the Massachusetts Institute of Technology, Boston, Mass., who designed the improved ventilating system of the United States Senate Chamber, is now at work on a similar system for the House of Representatives. He was directly responsible to the Committee on Rules for the work done in the Senate Chamber. For the House work he has been engaged under the general supervision of Elliott Woods. A great engineering change contemplated by the two bodies is the removal of the power and electric plants to a separate building at least 1000 feet distant from the Capitol building, where the exhaust steam which now goes to waste will be utilized for heating.

In a recent issue of the Buffalo *Courier* a half-tone engraving was presented showing a group, the proprietors, engineers and salesmen of the Buffalo Forge Works of Buffalo, N. Y., who devote themselves to the heating and ventilating department of the company's business.

John A. Fish, manager of the Boiler department of the Walker & Pratt Mfg. Company, Boston, Mass., visited among the steam fitters in New York and vicinity last week in the interest of the Walker line of Steam and Hot Water Heaters. These Boilers have many features of merit, and are made in a wide range of sizes adapted to the varied requirements of the heating trade.

The Tube department of the Carnegie Tube Company, Carnegie, Pa., was put into operation last week and this week was operated on a night schedule. The plant will produce Wrought Iron Tubes from ⅛ to 4 inches, and will have a capacity, when in full operation, of 100 tons a day. The officers of the company are: A. G. Hutchinson of New York, president; R. N. Vincent, vice-president; O. G. Grant, treasurer, and T. B. Everson, manager.

The Central Foundry Company of New York City were incorporated January 29, under the laws of the State of New York, with a capital of $100,000.

Sealed bids will be received at the Alamo National Bank, San Antonio, Texas, until February 5, for two elevators, steam heating, plumbing and electric wiring in the five-story bank and office building to be erected at the corner of West Commerce and North Presa streets, San Antonio.

C. E. Hautz, York, Pa., is remodeling the building he recently purchased and will occupy it with his plumbing and tinsmithing business.

Col. F. H. Phipps has decided to install a new heating system at the Watershops, Springfield, Mass., to replace the present antiquated and inadequate service.

Robert Love, for 37 years a resident of Brooklyn, N. Y., died from dropsy on January 27, at his home, 153 Eldred street, at the age of 43 years. Mr. Love was engaged in the plumbing business. He was an active member of the Greene Avenue Presbyterian Church. He is survived by his wife and six children.

The plumbers of Tacoma, Wash., and other cities on the Sound, are reported to be enjoying a harvest of jobs as a result of the recent blizzard.

Rochester, N. Y., is having a lively newspaper controversy over the recent enforcement of the plumbing regulations.

A movement is on foot to organize a society of central station heating engineers.

J. B. Carroll, 36 La Salle street, Chicago, is sending out an illustration of a night scene in winter, calling attention to the fact that on winter nights the lights burn longer and a good Burner asserts itself. This leads up to a consideration of the good points of the Hahn Acetylene Gas Burner. This Burner is manufactured and sold by Mr. Carroll, each part being produced by machinery especially designed for the purpose, and the assembling is done by trained workmen.

The Marcy Mfg. Company, Bluffton, Ind., manufacturers of Red Cross Wind Mills, Pumps, Tanks and Water Works Supplies, held their annual meeting on January 20, when the following officers were elected: President, William C. Elston; vice-president, G. A. Ulmau; secretary, E. V. Livers; treasurer, E. L. Murray, and general mauager, J. A. Ulman. The secretary's report showed a marked increase in the company's business for 1901 over the preceding year, and it was decided to increase their mauufacturing capacity in the near future.

The Putnam Foundry & Machine Company, Putnam, Conn., are sendiug out a notice stating that Wm. McGonigal, formerly local manager for the compauy at Mount Vernon, N. Y., has assumed the business there in his own name, having bought out their intercsts. He is authorized to collect all bills due the compauy, and he will finish all uncompleted work according to the specifications. All bills against the company will be paid from the main office at Putnam, Conn. The notice further says: "We wish him every success, and ask that you give him as loyal support in the future as you have given us in the past. We thank all our past customers and the people of Mount Vernon iu general for the many courtesies shown."

The Prizer-Painter Stove & Heater Company of Reading, Pa., have discontinued the sale of their Heaters iu New York territory through manufacturers' agents and will hereafter maintain a branch office of their own. The new location is at 160 Fifth avenue. The office is under the mauagement of Howard T. Gates, recently of the firm of Jamcs & Gatcs, and formerly New York manager for the Gurney Heater Mfg. Company. Mr. Gates has an extensive acquaintance among heating engineers and contractors, and will be glad to have his many friends inspect his handsome samples and learn why he is so enthusiastic over the Henderson Heaters.

James L. Schaadt, Mayor of Allentown, Pa., will receive bids uutil February 4 for heating two new fire engine company houses in that town.

The plumbing establishment of John W. Hainsworth, Wickford, R. I., was visited by a slight fire last week.

Hanlon Bros., Medina, N. Y., and J. McQuillan, who is interested with them, are doing a fine piece of plumbing in what is said to be the handsomest apartment house in Buffalo, N. Y. There are 100 bathrooms finished in tile with Italian marble trimmings, each equipped with a Standard enamcled bathtub, shower bath and other fixtures with heavily nickel plated trimmings. There will also be a handsomely fitted lavatory in the basement as well as drinking fountains on every floor. The plumbing in the servants' quarters is of equally high grade.

Rollin C. Wilson, 116 Nassau strect, New York, has added to his line of Plumbing Supplies the Champion Enameled Bathtubs, Sinks and Lavatories. Several styles of the Lavatories are on exhibition in his salesroom. He is also handling the fine line of Gas Fixtures and Side Brackets made by the Utica Fixture Company, as well as the Brass Fittings made by that concern.

New Firms and Changes.

The Adams & Jones Company of Boston, Mass., have been incorporated with a capital stock of $25,000, of which $500 has been paid in, for the purpose of manufacturing Heating Apparatus. The officers arc: Harry L. Cram of Portland, president; William F. Gilling, Jr., of Chelsea, Mass., treasurer.

J. A. Walp of Lehighton, Pa., has purchased the interest of Alvin Schaffer in the plumbing and tin business conducted under the firm name of Walp & Schaffer at Weissport.

John N. Martin has purchased the interest of his former associate, A. W. Hiscock, in the plumbing and heating business at Pittsfield, Mass. Mr. Martin has accepted a situation in a Lewiston concern.

Lewis J. Holser has succeeded Joseph Cooper in the plumbing aud steam fitting business on Pike street, Pontiac, Mich.

The Stewart & Bergen Company have been incorporated at Fort Plain, N. Y., with a capital of $15,000, by Archie Stewart, Christian Bergen and Frank Stieht, to deal in Plumbers' Supplies, Hardware aud Agricultural Implements.

Myron H. Richardson has purchased the interest of his former partner, the late Edward D. Lynch, in the long established and prosperous Plumbiug and Hardware firm of Lynch & Richardson, and will continue business alone under the old firm name, at Manchester, N. H.

Oldham & Ranahan are a new firm who succeed William H. Clark iu the tinsmith, plumbing and steam fitting business that he has conducted for the past 20 years at Southbridge, Mass. Mr. Clark retains the Hardware end of the business and will in future devote his entire time to that branch. Both Harry P. Oldham and John S. Ranahan of the new firm are experienced men, having worked for a number of years for Mr. Clark.

R. C. Wilson has purchased the Stove, Tin and Plumbing business of Wilson & Goodspeed at Malone, N. Y., and will coutinue business at the old stand under the name of R. C. Wilson & Co. Mr. Goodspeed of the old firm will remain in the employ of the new firm.

The Plumbers' Supply Company have succeeded the plumbing firm of Henry Fisher & Co. at Hazleton, Pa.

H. F. Garner has opened a tiu and plumbing business at Niagara Falls, South, Canada.

Charles Reidel of Orange, N. J., has purchased the plumbiug business of Walker & Ellam at South Orange, N. J.

Edward D. Sidman, heating engineer and contractor, informs us that he has formed a partnership with C. W. Blauchard and will do a general heating aud plumbing business at 105 William street, Solvay, N. Y.

J. C. Barrett has bought the interests of his partner, W. L. Thomas, in the Washington Plumbing Company, Washington, Pa., and will conduct the busiuess himself.

F. E. Tyler, Albion, N. Y., succeeds to the plumbing business formerly conducted by Tyler & Bennett. The hardwarc branch of the business will be continued by Charles Bennett.

The Pekin Gas Heating & Mfg. Company, Pekin, Ill., have been incorporated with a capital stock of $2400 for the purpose of manufacturing Gas Appliances and installing gas plants. The incorporators are James A. Eddy, Henry Webber and Charles N. Jewett.

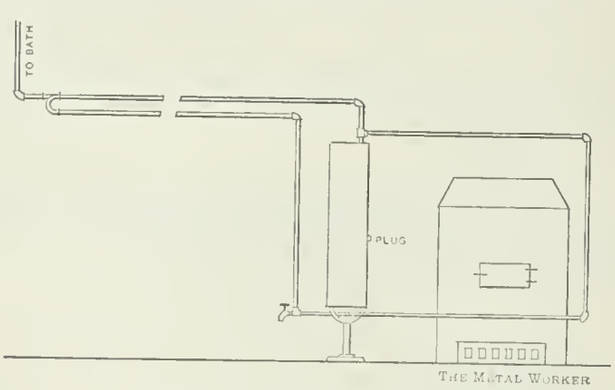
The Champion Sanitary Enamel Ware Company have been organized at Blairsville, Pa., with a capital stock of $300,000.

The Western Brass Mfg. Company of Chicago have been incorporated, with a capital stock of $5000, by J. Hadka, Casper Schweitzer and C. D. Baulicek.

Mineral Products of the United States.

Estimates of the mineral products of the United States for 1901, which have just reached the Treasury Bureau of Statistics, indicate that they will exceed in every particular those of any preceding year. In gold, in silver, in iron, in steel, in copper, in coal and in mineral oil the products of the United States in 1901 exceed those of any other country, and in every instance, except possibly copper, surpass her own record in any preceding year. The estimates of gold and silver, pig iron, copper, coal and mineral oil production put the gold production of 1901 at $80,218,800, against $79,171,000 in 1900, which was the highest record in gold production that the United States had ever made. They put the silver production of 1901 at 59,653,788 ounces, against 57,647,000 ouuces in 1900. The pig iron production is estimated at 15,800,000 long tons, against 13,789,242 long tons in 1900, in which year the figures exceeded those of any preceding year. The coal production is estimated at 267,850,000 long tons, against 240,965,917 long tons in 1900, the year of highest production heretofore. Of petroleum the production is estimated at 66,000,000 barrels, or 2,772,000,000 gallons, against 2,661,233,568 gallons in 1900, the year of largest production heretofore. Of copper the production is estimated at 595,000,000 pounds, or 265,625 long tons, or about 5000 tons below the figures of 1900, copper thus being the ouly item in the entire list which shows for 1901 a smaller figure of production than that of last year.

THE LETTER BOX.



Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

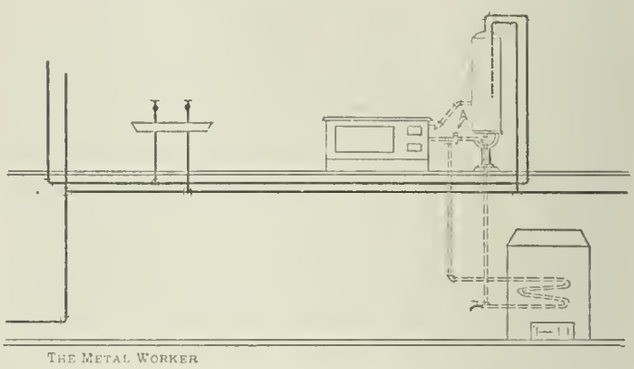
HEATING A BOILER FROM A FURNACE.

From A. R., Oberlin, Ohio.—Please advise me how to connect up a 40-gallon boiler with a hot air furnace. I would like to use in connection with it a circulating pipe to and from the bathroom fixtures. We have a city water supply under a good pressure. The hot water pipe after passing through the furnace must pass up over the top of the furnace before connecting with the boiler. The question is how to make the connection so that the job will circulate. I have drilled through the side of the furnace and run a pipe across the top of the fire pot.

Answer.—The questions presented are treated at some length in the book, "Kitchen Boiler Connections," which can be furnished by our Book Department. In the accompanying illustration we show how the boiler may be connected without any probability of trouble with the circulation if the work is properly done. One-inch iron pipe should be used from the bottom of the boiler through the furnace up over the top of the furnace and connected into the hot water service opening in the top of the boiler. To do this it will be necessary to take out a brass coupling. The service pipe to the bathroom need not be so large, the usual size being sufficient. Many plumbers use for a circulating pipe or

Heating a Boiler from a Furnace.

return pipe one size smaller pipe than the service pipe, in order to reduce the cooling surface exposed. If both pipes are of the same size and are covered benefit will be derived by the use of a larger size of pipe.



ROOF SWEATS.

From E. Q. R., Frankfort, N. Y.—I have a tin roof on a house that sweats badly in very cold weather. The roof is a steep one, and was originally covered with shingles. The building is in the shape of a T, having three gable ends, and there are windows 12 x 16 inches in size in each gable. In cold weather the roof sweats whether the windows are open or closed. The house is two stories in hight, without any floor in the garret, which is about 10 feet high in the center, running down to the eaves. I shall be glad to learn of a remdy for the sweating.

Note.—Our readers have discussed such problems in the past, and we shall be glad if they will lend their assistance to this correspondent. In the meantime, we would suggest that the sweating, or, properly speaking, the condensation, is due to the roof being cold, and moist air coming in contact with it on the underside leaves moisture in the form of small drops. Where the air is very moist a considerable condensation is likely and may cause annoyance. The best method of overcoming this trouble is to provide the same temperature below that exists above the roof. Under such conditions the moisture in the air will not condense.

COLD WATER FROM BOTH FAUCETS.

From Oliver Twist, Canada.—A few suggestions in regard to the trouble experienced by "I. D. H.," as presented in *The Metal Worker* of January 11, might not be out of place. It might be a disadvantage to have the water circulating through the furnace coil in the summer when the water was being heated by the range. This may be avoided easily by making a kind of by-pass between the bottom of the boiler and the lower connec-

Cold Water from Both Faucets.

tion in the range, leaving the connections to the furnace practically the same as at present, with the exception of having a valve placed between them. This valve would be closed when it was desired to heat the water from the furnace coil, the circulation being the same then as at present. But with the valve open, as it would be when using the range, the furnace would be cut out, because the circulation would be in the direction of the least resistance. This would avoid, with little expense, the cooling consequent on the long travel through the furnace coil when heating from the range. There would be no possible danger from the use of this valve, because, whether open or closed, there would be a way open for circulation. In the sketch herewith the valve is shown at A. The upper connection to range would be better with two 45-degree elbows.

MODEL FOR SMALL FURNACE.

From P. F., Creston, Ohio.—Can you give me any information as to how to make a model for a small furnace, to be cast out of zinc or babbitt metal, or where can I buy a book describing that line of work?

Answer.—Instructions for making a model of a furnace of an unknown kind is a very difficult matter. The making of a cast metal model involves the pattern maker's art and requires the same forms of pieces and cores as will be required in a large furnace. When patterns are made they have only to be molded in sand in the same manner as in molding for brass work, when the pieces may be cast in zinc, babbitt metal or any fusible alloy. We recommend our correspondent to make a study of pattern making in "Hasluck's Pattern Makers' Handy Book, which can be obtained from our Book Department.

PAINT FOR GALVANIZED IRON.

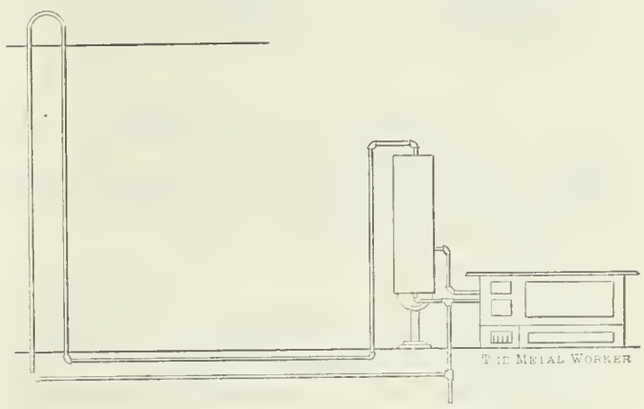
From O'Toole Brothers, Clinton, Mass.—We have waited to hear through your valuable paper more about paints for galvanized iron cornices, &c. We think that we have found a new and efficient method, and as it is just as fine looking to-day as the day it was put on, we are glad to give your readers the benefit of it. We built a three-story building some three years ago and used a large amount of galvanized iron work on the front, in connection with brick work. We let the metal stand some two months after being put on and then gave it two coats of red lead and one coat of U. S. aluminum bronze. This gave it a beautiful silver finish. We have had any number of inquiries from workmen as to what metal it is. The building is on a main business street, in which are three stores and half a dozen tenements, together with a number of offices. We would be glad to furnish a photograph to any one interested in building, showing the large amount of metal and how it looks.

UTILIZING WASTE HEAT.

From A. B. C., Brooklyn, N. Y.—The inquiry of "Southern Plumber," in *The Metal Worker* of December 7, has been very ably answered by "Northern Plumber." Still I think the subject furnishes an excellent example of hot water circulation, which perhaps all do not thoroughly understand. As hot water circulates according to natural laws, in this case, where there is only one continuous course for it to take, the water will circulate provided the mean gravity or density of the water in the ascending column is less than in the descending column. And its circulation will be the more rapid the greater this difference is. The upper radiator, by cooling the water as it descends, accelerates the circulation, while the lower radiator, by cooling the water as it ascends to the heating coil, retards the flow. Consequently, if the upper radiator was larger than the lower one it would tend to make the circulation better, even if it did not give the required amount of heat to the lower room. The best results would be obtained, however, by placing the heating coil as low as possible and then the radiators could be proportioned to properly heat the rooms. While the lower room would require a less amount of heat than the upper one, owing to the window being smaller, the temperature of the radiator would be less than the upper one, and its surface would have to be increased accordingly. Just what this amount would be would depend again upon the rapidity of the circulation, or the loss of temperature the water sustained in passing through the top radiator. While the upper radiator would always heat, if the flow was very slow the water would cool so much in passing through it that little benefit would be had from the lower one.

The amount of heating surface in the coil would be hard to determine unless some idea could be had of the temperature of the gases in the smoke pipe, but at best it would need to be much more proportionally than would be needed in a hot water heater, or if the coil were situated in the fire pot. Provided there is heat enough, a coil in the smoke pipe has the advantage that it can be so arranged with a passby and damper that the heat may be turned around it when the radiators are not used. A coil in the fire pot gives better results, but the heat here used is not entirely waste heat, and it has the disadvantage of always being in use when the fire is kept going, and consequently there is danger of boiling when the radiators are shut off. In this case I think it is desirable to have valves for supplying cold water and drawing off some of the hot water if necessary. Or, better, if the expansion tank is supplied with water through a ball cock there could be a small valve attached to the apparatus, which would open slightly by expansion if the temperature were too high and allow the hot water to flow out.

It has seemed to me that more could be done in regard to utilizing waste heat than is customary in general practice. A kitchen hot water boiler would often heat a small room above it if connected up with a small radiator, as "Northern Plumber" requests. And the heat wasted in the cellar, where it is not needed, by a heater of any kind could generally be conducted to a room above, if the heater were properly cased in and connected with air flues. I believe an upper room could be often very nicely heated if the smoke pipe from a range or heater below was carried up inside a properly constructed hot air flue. Why arrangements of this kind are not oftener used I am at a loss to tell, unless it is that those who pay for the coal used are not fully conversant with these matters, while those who install the work are too busy to study economy for others.



LOCATING REGISTERS AND LENGTH OF PIPES.

From R. M., La Chute Mills, Canada.—I should be glad to hear from the readers of *The Metal Worker* in reference to some questions on furnace work. Is it best to have both hot air and cold air ducts as short as possible? Is it good practice to place a hot air register and cold air register close together, particularly in church heating? I have had a little trouble with one church furnace job in which I think the cold air ducts were too long. The furnace had four 12-inch hot air pipes about 8 feet long, and four 12-inch cold air ducts about 15 feet long connected with registers, all located in the body of the church. I had to locate the registers according to the wishes of the managers of the church, not according to my own views on the subject. I hope that your readers will favor me with their ideas on this subject.

DIP IN PIPING INTERFERES WITH CIRCULATION.

From E. S., Iowa.—Can *The Metal Worker*, or some of its readers, give us some light on the subject of circulation under the conditions presented in the sketch herewith? The hot water pipe runs from the top of the range boiler down under the floor and across 8 or 10 feet, and then rises to the second floor. The return pipe follows the pipe back in the same way, except that it rises and connects with the cold water pipe that goes into the water front. Is there any way to overcome this trap so that the desired circulation will be accomplished?

Note.—We shall be glad if those who have had experience with this character of work will give their views as to how the piping should be arranged to secure

Dip in Piping Interferes with Circulation.

circulation. It would seem that it would be necessary to carry the hot water pipe under the floor boards of the second floor to avoid an air trap and secure a good circulation.

GALVANIZED TINNED SHEETS.

From S. W., North Georgetown, Ohio.—Can small tinned sheets be galvanized, and what is the easiest way to do it without much expense or apparatus?

Answer.—The book, "Galvanizing and Tinning," which can be furnished by our book department, covers this subject on a somewhat larger scale than is mentioned, but a small plant can be readily devised with the assistance of the information given. If the tinned sheets are small it may only be necessary to wash and dry them before they are dipped into the molten zinc, over which there should be a flux of sal ammoniac From the fact that the sheets are tinned already there will be no difficulty in galvanizing them. It will only be necessary that they should be cleaned of any grease or foreign matter before they are dipped into the molten zinc.

George Wright, 121 Fulton street, New York, publisher of Wright's Foreign Trade Directory and Gazetteer, has just issued Wright's Catalogue of America's Greatest Manufacturers in the Engineers' and Metal Trades. The book contains 653 pages, each 13½ x 10½ inches, and is cloth bound. In the front there are a number of striking views of important American buildings and scenes, with accompanying descriptive matter. The balance of the work is made up of advertisements of representative American manufacturers. This book is distributed gratuitously abroad in various quarters of the globe.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is firmer, but quiet.

Copper has advanced 2c., and is firm and more active.

Pig Lead was marked up 1-10c. per lb.; demand is quiet.

Spelter is quiet and easy.

Antimony is unchanged.

Nickel is firm and without change.

Aluminum is active and unchanged.

Tin Plates are in fair demand at former prices.

Sheets are still scarce and prices unchanged.

Sheet Copper is very active, with prospect of advance in sympathy with Ingot.

Scrap Iron is active and higher.

Scrap Brass and Copper are firmer and moving more freely.

Pig Iron is scarce for spot and strong in price with large demand.

Hardware is moving in good volume, with prices firm as a whole.

Lead Traps and Bends were advanced in price.

Cast Iron Pipe and Fittings are firm, with prospect of an advance.

Nuts were advanced 1-10c. per lb.

Roofing Materials are firm, with active demand.

Washers have been marked up in price.

Conductor Pipe and Eave Trough are strong, with possibility of higher prices.

Wire Nails are firm and in good demand.

Cut Nails are moving in fair volume at unchanged prices.

White Lead is active at former prices.

Linseed Oil is 1c. per gallon higher in price.

Spirits Turpentine has been advanced 1c. a gallon; demand is light.

Old Rubber is quiet and weak.

METAL MARKET.

NEW YORK, January 31, 1902.

Pig Tin.—Since the date of our last report Pig Tin prices receded somewhat until Thursday, when a firmer tone was established in the market, and prices reacted to nearly the level of a week ago. Spot business has been very quiet, consumers buying sparingly. There was, however, more buying in futures, owing to the lower figures made for extended deliveries. Jobbers quote Straits Pig in small lots at 24½c. to 25c. per lb. Arrivals during the month amounted to about 2800 tons, with over 3000 tons afloat.

Copper.—Three sharp advances occurred in the price of Copper during the week, bringing the metal up 2c. above the figures ruling at the date of our last report. The reason for this sharp reaction in the metal is not quite clear, but it is reported in the trade that the New York bull element is at work, and that the principal producers are supplying them with all the metal they want and helping the good work along. The present upward movement, having many speculative signs, is not generally expected to endure for any great length of time. Nevertheless, the market at this writing shows more strength than for some time past, although whether prices will reach a much higher level is a matter of great doubt. Jobbers are now quoting Lake Ingot in small lots at about 13¾c. to 14c. per lb., and Casting Copper at 13¼c. to 13¾c. The rise in Copper values here has been accompanied by a smart upward movement in the London market. It is claimed that a large business was done at the lower figures, for both consumptive and export account. At the close the market was very quiet, so far as new buying was concerned.

Sheet Copper.—The reduction in the price of Sheet Copper to a 16c. basis last week was followed by a great rush of orders, consumers apparently being satisfied that the metal had reached the lowest price at which it was likely to sell for a long time. The manufacturers and dealers were crowded with orders for spot delivery, but refused to accept contracts for future deliveries at the ruling prices. The large increase in the volume of orders prove conclusively that stocks of Sheet Copper in dealers' and consumers' hands throughout the country are very light. The upward reaction in raw Copper this week makes it possible that Sheet Copper prices will also undergo an advance in the near future, should the higher level of prices for Ingot seem likely to hold.

Pig Lead.—An advance of 10c. per 100 lbs. in the price of Pig Lead was made this week by the American Smelting & Refining Company, who also sent a notice to the trade to the effect that, on and after February 12, the quoted figure of the company will apply only to metal bought 15 days in advance of delivery. For strictly spot metal an extra charge is added. This action has been taken in order to induce consumers to buy ahead of their immediate requirements. The demand for Pig Lead is referred to as fair for the season. The market closed steady, jobbers quoting American Pig in small lots at 4.40c. to 4½c. per lb.

Spelter.—The market for Spelter continues quiet and the tone easy, without any change in prices. Good Western brands in small lots are quoted by jobbers at 4⅝c. to 4¾c. per lb.

Sheet Zinc.—There is a fair demand for Sheet Zinc, which is quoted by jobbers at 6¾c. per lb for 600-lb. cask lots and 7¼c. for smaller quantities.

Antimony.—No change is recorded in this market. Hallett's and U. S. in small lots are quoted at 8¼c. to 8¾c. and Cookson's at 10¼c. to 10¾c. per lb.

Nickel.—The market is unchanged, small lots being quoted on the basis of 60c. per lb.

Aluminum.—The demand for Aluminum continues brisk. Prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is entirely without change, the conditions being as noted in our last report. The larger consumers are covering their wants for the first half of the year and the smaller trade are buying in fair volume on a hand to mouth basis. Prices show no quotable change. American Bessemer Coke Plates, IC, 14 x 20, in small lots, delivered at New York and corresponding points, rule at about $4.85 to $5.10 per box.

Sheets.—The condition of the Sheet market remains fairly strong, the mills all being well filled with orders for the next 60 days or longer. The competition of outside Sheet mills, however, is beginning to tell to some extent on the market, as some lower prices are said to have been accepted in certain quarters on desirable orders. A meeting of Sheet mill men, to be held in Pittsburgh on Monday next, is awaited with a good deal of interest. The matter of a source of supplies for Sheet Bars will be actively taken up. There is some talk of some of the independent mills coming together and building an Open Hearth Steel plant. Prices for small lots of Sheets are unchanged. No. 27 One Pass Cold Rolled Soft Steel Sheets are quoted at about 3.95c. to 4c., and Galvanized Sheets at 67½ and 5 to 70 per cent. off the list.

Chicago advices are as follows: The inducements offered by independent mills are attracting buyers, and a great deal of contracting is being done for future delivery. This business is being stimulated to some extent by the belief that the independent mills will shortly advance their prices. Meanwhile prices made are having

effect on quotations from store at 3.05c. to 3.15c., Chicago, and small lots from store at 3.35c. to 3.45c., but reports of lower store rates are in circulation. Small lots of Galvanized are quoted in a regular way at 70 and 2½ to 70 and 5, but lower prices are also current on this class of Sheets.

St. Louis advices are as follows: A good active trade is being cared for in the market for Sheets of all grades and sizes, and no changes are to be noted in the list of prices. Jobbers quote: Stove Pipe size, No. 27, 3.45c. to 3.50c.; Galvanized Sheets, 65 and 10 off, and in round lots, 70 to 70 and 5 off.

Old Metals.—Scrap Iron is in active demand and prices have stiffened. Scrap Brass and Copper are also moving in better volume, with prices firmer. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 9½c.
Light and Tinned Copper	per lb. 7¾c.
Heavy Brass	per lb. 7¼c.
Light Brass	per lb. 5¾c.
Lead	per lb. 3¾c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 3 c.
No. 1 Pewter	per lb. 15¾c.
No. 2 Pewter	per lb. 8 c.
Tin Plate Scrap, per gross ton	to $5.00
Wrought Iron Scrap, per gross ton	$11.50 to 12.00
Heavy Cast Scrap, per gross ton	11.00 to 11.50
Stove Plate Scrap, per gross ton	10.00 to 10.50
Burnt Iron, per gross ton	6.00 to 7.00

THE PIG IRON MARKET.

New York.—The market is strong and the feeling is growing that later on there will be considerable trouble about deliveries. Local buyers have again taken fair amounts, the largest purchase being of one lot of 5000 tons by a Pipe foundry. We quote for Northern Irons: No. 1, $17.15 to $17.50; No. 2 X, $16.65 to $17; No. 2 Plain, $16.15 to $16.25; Tennessee and Alabama brands, No. 1 Foundry, $16.25 to $16.75; No. 2 Foundry, $15.75 to $16; No. 1 Soft, $16.25 to $16.75; No. 2 Soft, $15.75 to $16; No. 3 Foundry, $15.25 to $15.50; No. 4 Foundry, $14.75 to $15.

Chicago.—Foundrymen are still buying very freely, both for forward delivery and for quick shipment, wherever a furnace company can be found to make a promise. Spot Pig Iron is in as great demand as ever, showing that many foundries have light stocks. Prices are very strong. Some of the Southern furnace companies are now asking an advance of 50c., while few of them are able to promise anything before July. We quote as follows:

Lake Superior Charcoal	$19.50 to $20.50
Local Coke Foundry, No. 1	16.50 to 17.00
Local Coke Foundry, No. 2	16.00 to 16.50
Local Coke Foundry, No. 3	15.50 to 16.00
Local Scotch, No. 1	16.50 to 17.00
Ohio Strong Softeners, No. 1	19.50 to 20.00
Southern Silvery, according to Silicon.	16.90 to 17.15
Southern Coke, No. 1	16.40 to 16.65
Southern Coke, No. 2	15.65 to 15.90
Southern Coke, No. 3	15.15 to 15.40
Southern Coke, No. 1 Soft	16.40 to 16.65
Southern Coke, No. 2 Soft	15.65 to 15.90

Philadelphia.—Prices are now pretty generally accepted as being on the basis of $17 to $17.50 for No. 2 Foundry for ordinary contracts. Prompt shipments may call for 25c., or even 50c. more, but the demand for deferred deliveries is less urgent than it was earlier in the month. Business in hand has dropped back into its ordinary channels at an established advance during the month of $1 to $1.50 per ton. Further advances, it is believed, will be unadvisable, and the strongest interests are doing their utmost to prevent speculative operations. Low grade Foundry Iron finds a ready market at relatively high prices, but the offerings are unusually light. The range of prices is now as follows for Philadelphia and nearby deliveries: No. 1 X Foundry, $18 to $18.50; No. 2 X Foundry, $17 to $17.75; No. 2 Plain, $16.50 to $16.75.

Pittsburgh.—The situation in Pig Iron is very strong. There have been heavy sales of Foundry Iron for the third quarter and the market for this class of metal is very firm. We quote No. 2 Foundry at $16.50 to $16.75 and No. 1 at $17 to $17.25, f.o.b. cars Pittsburgh.

Cincinnati.—The Pig Iron market continues to show a very considerable degree of activity. There has been quite an amount of business booked for the third quarter of the year and no insignificant tonnage for the last quarter. Agencies here are considering January just closing to be a record breaker, when the field at large is considered. There is no cessation of the complaint regarding car shortage north of the Ohio River. There is not much change in the price-list. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	to $15.25
Southern Coke, No. 2	to 14.75
Southern Coke, No. 3	to 14.25
Southern Coke, No. 4	to 13.75
Southern Coke, No. 1 Soft	to 15.25
Southern Coke, No. 2 Soft	to 14.75
Southern Coke, Gray Forge	to 13.75
Southern Coke, Mottled	to 13.75
Ohio Silvery, No. 1	$16.25 to 16.75
Ohio Silvery, No. 2	15.75 to 16.25
Lake Superior Coke, No. 1	to 17.35
Lake Superior Coke, No. 2	to 16.85
Lake Superior Coke, No. 3	to 16.35

St. Louis.—We can report no changes of note in the Pig Iron situation in this section. Stocks in hand have been gradually getting lower and this week a much smaller available supply is reported. There is no dearth of good orders and inquiries, and a lively trade for immediate delivery would be in progress if only the metal could be supplied. The price-list is without change. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$15.75 to $16.00
Southern, No. 2 Foundry	15.25 to 15.50
Southern, No. 3 Foundry	14.75 to 15.00
Southern, No. 4 Foundry	14.25 to 14.50
No. 1 Soft	15.75 to 16.00
No. 2 Soft	15.25 to 15.50

CHICAGO REPORT.

Scrap Iron and Steel.—The demand is now readily taking all the stock offering. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$11.50 to $12.00
Machinery Cast	11.00 to 11.50
Malleable Cast	10.00 to 11.00
Stove Plate (free from burnt)	8.50 to 9.00
Burnt Iron and Grate Bars	6.00 to 7.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	to 9.00
Breaking Stock	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c	to 7.00
Old Boilers—whole (Iron)	6.50 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	10.00 to 11.00
Old Gas Pipes and Boiler Tubes	11.00 to 11.50
Cast Borings	5.00 to 5.50
Turnings	10.00 to 10.50
Horseshoes	12.00 to 12.50

Old Metals.—Old Copper and Brass are in strong demand, but dealers are not disposed to sell, believing that prices will be higher. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	9½c.
Copper Bottoms	8¼c.
Copper Clips	9 c.
Red Brass	9 c.
Yellow Brass	7 c.
Red Brass Borings	8½c.
Yellow Brass Borings	6 c.
Light Brass	5¾c.
Pipe Lead	3.50c.
Tea Lead	3.25c.
Zinc	2¾c.
Tin Foil	18 c.
Pewter, No. 1	16 c.
Pewter, No. 2	14 c.
Aluminum	20 c.

Old Rubber.—Very little is doing at present. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.50	.....
Rubber Shoes	....	6¼c.
Rubber Car Springs	....	5½c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6¾c.
Black Rubber	....	4¼c.
White Rubber	....	8 c.

Rags.—Dealers quote buying prices of good Country Mixed Rags, Chicago delivery, at 75c. to 85c. per 100 lbs. in any quantity.

Anthracite Coal.—Trade is brisk, owing to severe weather. Prices are unchanged, as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

The good volume of business referred to in our last issue continues. Both manufacturers and dealers are fully occupied. Travelers are generally again on the road, and their activities are resulting in good orders, while their reports very generally reflect an excellent condition of things and predict a large business during the season. The trade are not disposed to buy in a speculative spirit, but are placing liberal orders, and are influenced somewhat by the apprehension of scarcity in certain lines. The general tone of the market is decidedly firm and several advances are reported. There are, at the same time, some concessions on certain lines which come about in connection with a revision of costs and as a result of special circumstances, rather than indicating any weakness in the market as a whole. The condition of the Copper market is having some effect on goods into which this metal enters. Foreign business continues to be, on the whole, in a very satisfactory state. The intelligent efforts which are being constantly made by representative manufacturers to make a place for their goods abroad is little by little resulting in a steady increase in the kinds and volume of goods which go abroad. Many of these efforts are made unobtrusively, and the manufacturers cultivating this class of trade often prefer to do it as a still hunt, rather than with a flourish of trumpets. Much is being done throughout the country in increasing the production of Hardware and related goods, as many manufacturers are enlarging their works. Wages are gradually creeping up, not so much in the way of a general advance as in individual cases. A good many manufacturers refer to the difficulty they have in obtaining skilled workmen. The financial condition is excellent. Collections give little cause for complaint.

NOTES ON PRICES.

Lead Traps and Bends.—The manufacturers of Drawn Lead Traps and Bends have advanced prices. The change took place on Tuesday, January 28, 1902. The best price now quoted by the manufacturers and jobbers to the trade for quantity orders is 55 and 5 per cent. from the lists of June 3, 1901. It is believed that there is no likelihood of any disturbance of prices of this line of goods for some time to come, as all contending interests have been harmonized.

Cast Iron Soil Pipe and Fittings.—The market for this line of supplies has been kept in a satisfactory condition, owing to the mild weather heretofore experienced in the East, which has enabled the trade to continue their work of "roughing" the buildings now in process of construction. Prices among the jobbing trade have been stiffened up within the past week or two in anticipation of an advance by the manufacturers, which, it is rumored, may take place in a short time.

Plumbers' Brass Work.—The manufacturers of Brass Work are decidedly nervous at the present time. The advances in the Copper market this week are responsible for this condition. On Thursday evening the manufacturers withdrew all prices on Brass Work. It looks as though the manufacturers have had enough of low and unprofitable prices and are not anxious to take any risks.

Nuts.—The manufacturers of Cold Punched Nuts and Hot Pressed Nuts have advanced their prices on these goods 1-10 cent per pound.

Tarred Roofing Materials and Building Paper.—The recent combination in these goods has not developed any material effect so far, except an increased firmness in prices and a desire on the part of a considerable portion of the trade to protect themselves against an advance in the immediate future. In the East the market still continues steady, with a good midwinter demand. The desire on the part of those in control to compromise contracts with some of the salesmen rendered supernumerary by the recent absorption of the Union Coal Tar & Chemical Company, Chicago, by the Barrett Mfg. Company and others apparently indicates that the latter interests believe they now control the situation. The market on Tarred Roofing Felts is represented by the following retail prices: $30 to $31 per ton for One-ply, 50 to 55 cents per roll for Two-ply and 70 to 75 cents per roll for Three-ply, although these latter quotations are affected somewhat by the territory to which they go. Rosin Sized Sheathing in less than carloads, delivered, $28 to $30 per ton. Small lots of, say, a ton or so, are quoted: Light Weight, 35 cents per roll; Medium Weight, 47 cents, and Heavy, 58 cents per roll, delivered.

Washers.—Last week an advance was made by the manufacturers in the price of Washers, and the market is now represented by the quotation of 6 cents off list. The demand for this line of goods is large, and some of the factories are behind their orders.

Double Pointed Tacks.—This is a line which does not appear to be characterized by as satisfactory conditions as others. Notwithstanding the large volume of business and the cost of the raw material, prices are low and uneven.

Conductor Pipe, Eave Trough, &c.—The market for this line is regarded by the manufacturers as in excellent condition, and some of them are showing a good deal of conservatism in accepting orders. It is intimated as not unlikely, in view of the condition of the market in the raw material and the large demands the trade are making upon the makers, that prices will be advanced before very long.

White Lead.—A fair business is reported in White Lead in Oil for prompt delivery, while a larger number of orders are being booked for February and March delivery. Reports of concessions of ¼ cent per pound continue. White Lead in Oil, in lots of less than 500 pounds, New York, is quoted at 6½ to 6¾ cents per pound.

Linseed Oil.—The expected advance in the price of Linseed Oil was announced on Thursday. The advance is due to the strong market for seed. There is the usual seasonable distribution of Oil in small lots. Prices are firm at 63 to 64 cents per gallon for City Raw in small lots.

Spirits Turpentine.—Owing to reports from Southern markets Turpentine has advanced 1 cent per gallon during the week. These reports indicate that receipts thus far are running considerably behind last season. The market at this point is quiet, with little Turpentine changing hands, while holders are firm, refusing to sell at lower prices. Turpentine in small lots is quoted at 45 to 45½ cents per gallon.

Old Rubber.—The demand for Old Rubber is light and prices do not show any particular strength. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	5¼c.
Rubber Shoes, less than carloads, per lb	6½c.
White Wringer Rolls, per lb	6¾c.
Inside Bicycle Tubing, per lb	21½c.
Outside Tubing, per lb	6¾c.

TRADE NOTES.

The Ideal Brass Foundry have been organized at Saginaw, Mich., by Andrew Murray and Frank J. Maruna. The company will make a specialty of Brass, Bronze and Aluminum Castings.

The Wolf Company, Chambersburg, Pa., will shortly be incorporated for the purpose of operating a plant for the manufacture of Rolling Mill Machinery. H. G. Wolf, J. J. Pollard and J. A. Strite are the incorporators.

As soon as weather will permit, the Lincoln Paint & Color Company will erect a large plant at Lincoln, N. J.

The Kenosha Mfg. Company have started a new enterprise at Kenosha, Wis., turning out Sheet Metal Novelties, Tools and Steel Dies. The prime movers in the company are Hudson F. Blackman and Walter E. Crlstain.

The Memphis Pump Company, Memphis, Tenn., suffered a $20,000 loss by fire at their plant recently. The finishing room, office and recently built tinning room, with entire contents of machinery, finished Pumps, &c., were destroyed.

Plan to Avert Building Strikes

For the last three or four months William H. Sayward, secretary of the National Association of Builders, has been at work in New York City investigating the labor problem as it appears in the building trades of the metropolis. The object of this effort is to secure the co-operation of employers and workmen in the trades named looking toward the establishment of a permanent court of settlement and appeal, in which all of the building trades shall have representation through both employers and workmen, and make annual agreements covering all the rules and conditions which shall prevail in each trade for the year ensuing.

The plan as proposed comprehends such a composition of the court as will give the community its proper consideration, following out the theory that the labor problem is composed of three factors—the employer, the workman and the community—and that no one of these factors or no two have a right to settle conditions conclusively without the co-operation of the others.

Mr. Sayward has thus far been engaged principally in investigation, interviewing a great many employers in all of the building trades individually, making selection of the most influential to determine whether they feel assured that the time is ripe for making a movement of the radical character contemplated, which will be in effect a recognition of the value of co-operation of employers with labor organizations looking to the settlement of all affairs of mutual concern. He has also obtained many interviews with representative workmen and officers of various unions in the building trades to determine whether, on their part, the mass of workmen would be in favor of the establishment of such a court which would place the whole of these relations of employer and workman in a fair way for settlement upon a thoroughly business basis.

He has, thus far, received great encouragement from employers and workmen, they having heartily approved the plan as ideal in character and as being upon a very dignified and businesslike plane. There are many difficulties to overcome owing to the complicated conditions existing in the metropolis which have largely arisen from failure to comprehend the true relations of employer and workman and the value of application of organized effort. There are, however, no difficulties that cannot be overcome by persistent and earnest endeavor along the lines indicated.

Having secured the approval of employers and workmen individually to a sufficient extent to determine the reasonableness of further action, steps are now being taken to obtain the adhesion of the various bodies of employers and workmen. Thus far, too, Mr. Sayward has received the hearty indorsement of such organizations as have been so addressed. He is holding meetings in the city every week and reaching as many organizations as possible, principally, up to the present time, those of employers. All of the organizations of workmen are being addressed through their proper officers, and their adhesion will be sought during the coming months.

The plan briefly outlined is the establishment of a court of settlement and appeal which shall have as its permanent members three persons entirely outside the constituency of the building trades, and to be selected as follows: One by the workmen of all the trades acting collectively, one by the employers of all the trades acting collectively through committees appointed for the purpose, and these two to select a third, also outside the constituency. These three persons are to be preferably men of legal training and judicial character and of such high standing in the community as to lend dignity to the tribunal; they to practically furnish the balance of the court and preserve the community's interest in the conduct of the court's function. These three permanent members of the court form the nucleus. The full court is to be composed by the selection of three workmen and three employers who joined with the three permanent members will make a court of nine. These workmen and employers are to be selected from each trade and to act consecutively in sitting in the interest of that trade in making annual agreements. The three permanent members thus sitting with six representatives of each trade in succession will be able to preserve the decisions from conflict and complication one with another and will from their character lend dignity and significance to the decisions of the court, while at the same time bringing the whole determination of affairs for the building trades upon an infinitely higher plane than they have previously been.

All decisions of the court will be open to the public, and will be conclusive and binding upon all parties. During each year the court will be available for reference in case either employers or workmen in any branch fail to live up to the agreement as announced, the whole to be determined by the court and no strike or lockout of any name or nature be permitted under any circumstances.

Any new features or ideas looking to a change, modification or extension of the rules for any trade during the interim between times of annual agreements are not to be permitted because of abandonment of work but are to be referred to the court for consideration and digestion during the balance of the year, and are to come up for actual consideration at the time of the next yearly agreement.

From the statements above presented it will be seen that this is a radical, yet, at the same time, comprehensive plan, and simple in its principle. It is based entirely upon the idea that it is possible to settle the affairs of mutual concern to employers and workmen, in the building trades at all events, upon lines that are just, fair and businesslike.

"BOSS" WASHING MACHINES.

Trade-Mark.

Closed View.

Illustration of the latest improved "BOSS" double action and rub board washing machine. Has all gearing enclosed and other important improvements.

SIZES: { 7, 8, 9, wood frame lower cylinder. / 10, 11, 12, steel frame lower cylinder.

We are also the patentees and manufacturers of the following:

The Boss Internal Gear Washer,
" " External " "
" New Boss Rotary "
" " Champion Rotary "
" " Standard Champion "
" Standard Perfection "
" Banner Washer and
" Improved Standard.

The washers are carried in stock in carload lots in all the principal cities. Write us and we will quote you prices and at same time advise you as to where and from whom you can obtain them from stock, thereby, perhaps, saving extra cost of freight, than when shipping from factory. These washers are carried in stock under jobbers' special brands, but none are genuine without our name and address appearing on each machine. Write for one of our beautifully illustrated and descriptive catalogues, mailed free upon application.

BOSS WASHING MACHINE CO., P. O. Station H, Cincinnati, O.

—A KINDERGARTEN teacher undertook to loosen the jacket of a boy in order that he might more comfortably participate in gymnastic exercises. "Please don't," gently protested the lad. "I'm sewed up for the winter."

—BUT HE DIDN'T SEE IT.—Mr. Cadd: "No, indeed, I never associate with my inferiors. Do you?"

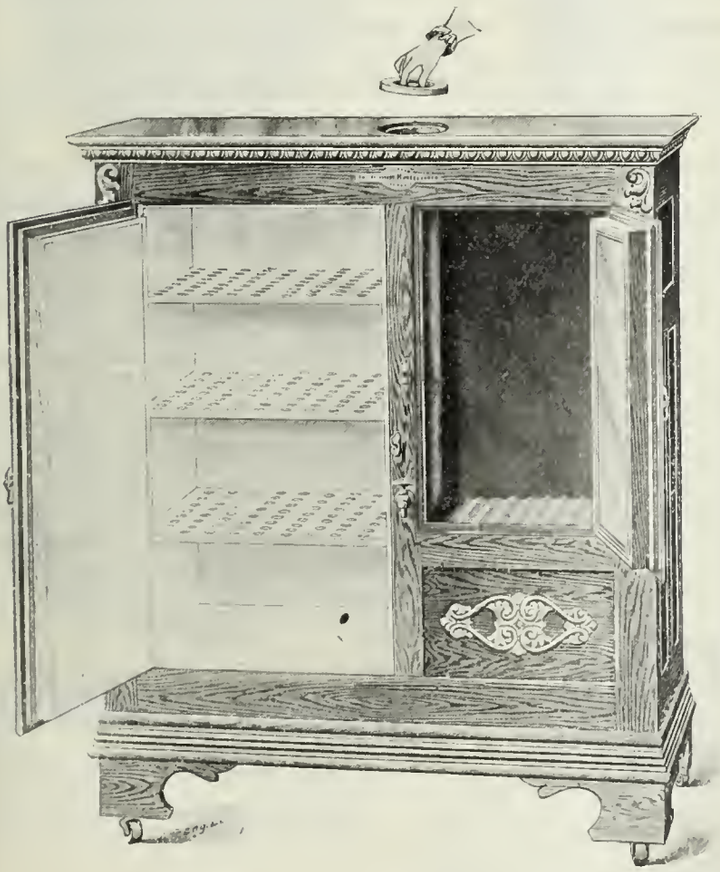
Miss Peppery: "Really, I can't say. I don't think I ever met any of your inferiors."—*Exchange.*

The White Mountain Freezer

STANDS THE TEST OF TIME

A white Mountain Freezer, with ordinary care, will outlast a generation of people.

There is a solidity of construction, a lack of friction that makes it wear well. Every part fits its companion part, resulting in perfectly smooth action.



If you want to sell the freezer that always gives satisfaction, that is in greatest use, that is spoken of oftenest, and most favorably, sell the WHITE MOUNTAIN. If you want to know more about it write to-day for our new catalogue. It will come to you free of expense.

Every Leading Jobber handles the White Mountain Freezer, and will quote you prices by return mail.

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION

A USEFUL hand book for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 ⁘ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ⁘ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ⁘ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

A Few Points About
The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe
It is handsome. It is strong. It is the best elbow on the market.

Here's a Riddle for you!

IT IS DEAD EASY!

What works without working,
It's work never shirking,
But quiet and stealthy,
Makes all buildings healthy;
Cures chimneys of smoking
(That habit provoking),
And to the supplier
Brings many a buyer?

Answer—

THE ANCHOR VENTILATOR!

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.

METAL CEILINGS AND WHY

Because they are just as suitable for offices as they are for stores, churches, schools, restaurants, halls, etc.

They are economical, mechanically excellent and of great artistic beauty.

They can be had in plain or ornamental patterns, can be decorated to harmonize with finish of room and of furniture.

They have valuable constructional features which simplify their erection; are easy to keep clean; stand wear and tear; **STAY UP.**

"BERGER'S Classik METAL CEILINGS"

are **HIGH ART** Ceilings; handsome in design; correct in style; and stamped with a clearness which brings out the detail in bold relief.

If you have only seen the ordinary run of stamped ceilings, it is more than likely you do not realize how much better and more attractive Berger's Classik Metal Ceilings are.

Write for our handsome Catalogue and full particulars.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

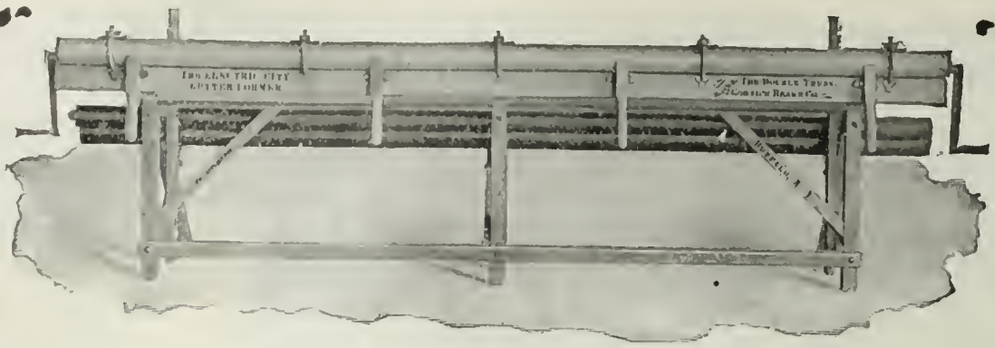
In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials —13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections) —325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.



All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose. This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

Jenkins Bros.' Valves

are manufactured of the best steam metal, and are fully guaranteed. Why experiment with cheap valves? If you want the *BEST* ask your dealer for valves manufactured by Jenkins Brothers. Remember all genuine are stamped with Trade Mark like cut.

JENKINS BROTHERS, New York, Philadelphia, Chicago, Boston,

ROUND OAK STANDARD OF AMERICA

How do these facts strike you?

A merchant cannot stay in business long on "one time" sales. It is the continued business from satisfied customers upon which he must count. There is a certain amount of profit in selling any range whatever, but there is not enough profit to pay him for losing the trade of any good customer. Round Oak Ranges are good ranges to use in the education of a customer. They teach him that you sell the right sort of goods. If you have sold him a Round Oak Range or stove or furnace he will forever after believe in you and your goods.

How do these facts strike you? New catalogue out March 1st.

QUICK MEAL

We wish to call special attention to our line of **Cabinet "QUICK MEAL" Evaporating Gasoline Ranges.** We make the largest line of **Evaporating Stoves** made. These stoves have been thoroughly tried and have proved both satisfactory and durable. The **"QUICK MEAL" Evaporating Stoves** have stood the **severest tests,** and stand to-day the unrivaled leader of all Evaporating Stoves made.

Our line of **"QUICK MEAL" Stoves** for 1900 will be more complete than ever; both in **Gasoline** and **Blue Flame Oil Stoves.** They are perfect in design, perfect in workmanship, and perfect in assortment.

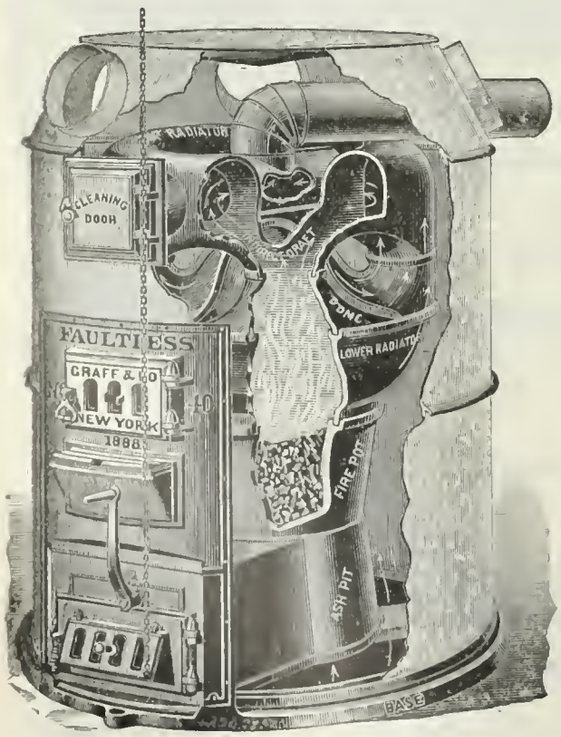
IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.



You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

FIVE HUNDRED DEALERS

in the United States have sold **RIVAL** furnaces for the past fifteen years and are selling them now. They have allowed other dealers to put in the **CHEAP WORK** and have given their customers

RELIABLE FURNACES

wisely installed and thoroughly efficient in operation. Where **RIVAL** furnaces have been sold the general tone of a furnace business has been advanced to a higher level. Where they have not been sold the furnace business has been in disrepute. Dealers that have had an unsatisfactory business during the past year, have had

MUCH TROUBLE and LITTLE PROFIT

should consider that possibly it is owing to the character of the heaters they sell. We want good dealers to sell our furnaces, install them in a good manner, and good satisfaction will result with increased business at good profit Our catalog illustrates and describes the line of heaters we make and on application we will quote right prices.

STOVES, RANGES and FURNACES.

SEND FOR CATALOG.

MILWAUKEE, WIS.

THE average manufacturer of Furnaces, when getting out a new Furnace, thinks it necessary to have special talking points; something different from his competitor.

Perhaps, if he works on it long enough and dwells upon the why and wherefore of some complicated flue construction, massive front, artistic ornamentation, he really believes he has the great and only best heater and coal saver that ever was, and wonders why you can't pay him extra dollars for it.

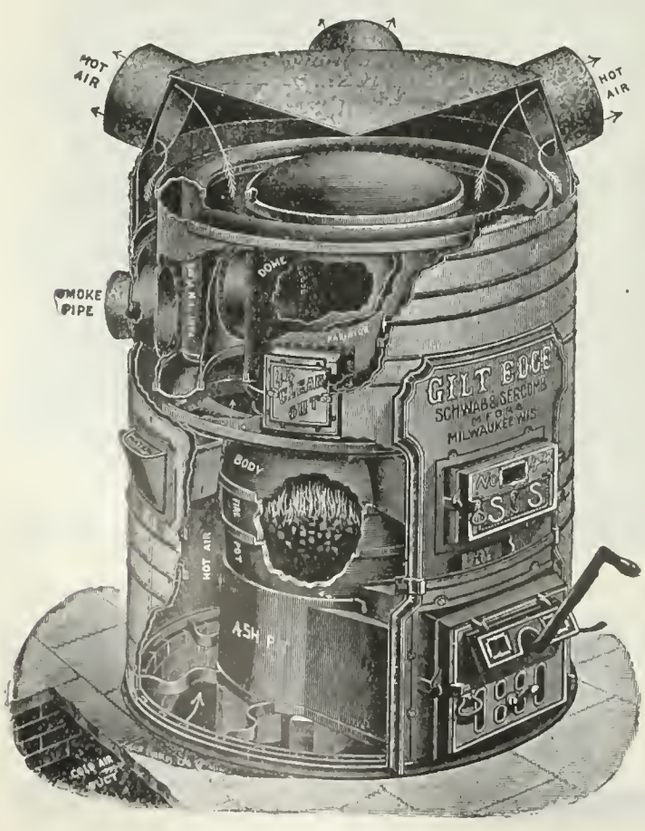
The average dealer has already learned a lot about theory; it's results that count.

Set a *"DIGHTON"* in the next house or same block of houses where there is a chance for fair comparison, ask your customer how many rooms are heated, how much coal was used, how many months he had a fire; if at the end of *one,* two, five or ten years your customer don't think the *"DIGHTON"* the best value of any furnace on the street, let us know about it.

Name, sentiment, theory or ornamentation don't count so much as results.

Compare *"DIGHTON"* results with any other Furnace, no matter what the price of it may be.

DIGHTON FURNACE CO., - - Taunton, Mass.



For a swell job

You ought to know our line—many a dealer loses an opportunity to make a good profit because he knows only heating stoves and furnaces.

We can post you concerning steam and hot water heating, so you can get a share of what is due you.

KEWANEE BOILER COMPANY

They regulate heat in residences, offices, stores, mfg. plants. Guaranteed.

The Howard Thermostat Co.

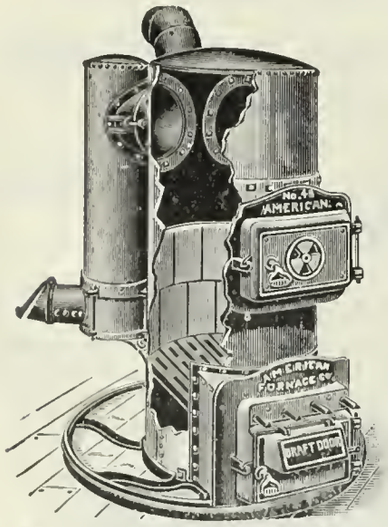
West Water Street, Oswego, N. Y.

No electricity or compressed air Simple as a heavy spring motor can be.

Would like to send you their catalogue and give a few reasons why you should sell their Heat, Valve, Draft and Damper Regulators. This should be an interesting topic. We have the most simple thermostat made; also the most sensitive. Only three parts—a sensitive and powerful sensitive plate, a heavy spring motor made of brass, and common pulley connections. Just enough material to do the work satisfactorily, but not one atom too much. They do "straight work," without the aid of outside agencies. No other thermostat on the market can do more with all of its electricity and compressed air connections.

THEY SAVE THE COAL

WHICH IS WASTED BY THE WRONG OPERATION OF FURNACE OR BOILER DAMPERS.



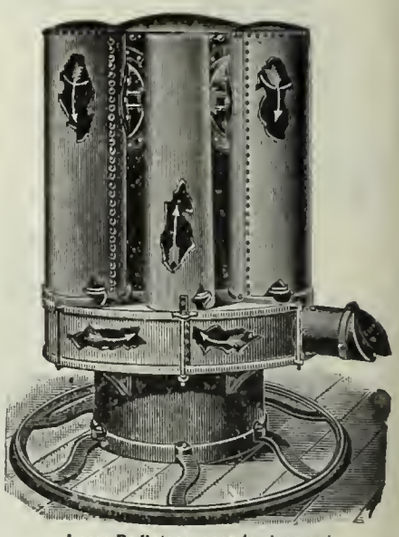
WINCHESTER

The value of time was never more appreciated by the people than at present. Can the fitter afford to lose any time in securing the agency of the "WINCHESTER" Heater, justly acknowledged to be "America's Greatest Heater?" Made by Smith & Thayer Company, Boston, Mass., 106 Beekman St., New York.

HEATER.

Burn Hard or Soft Coal, or Coke. Large Doors.

About Fire Pots.

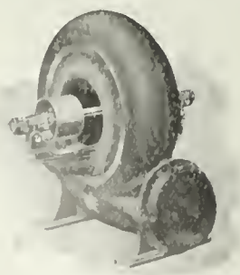


We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

The American Furnace Co.,



1911-13 PINE STREET, · ST. LOUIS, MO.

Large Radiators, easy to clean out.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Annunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.
Chapter IX.—Running Wires in Finished Buildings.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

SENT, POSTPAID, ON RECEIPT OF PRICE, BY

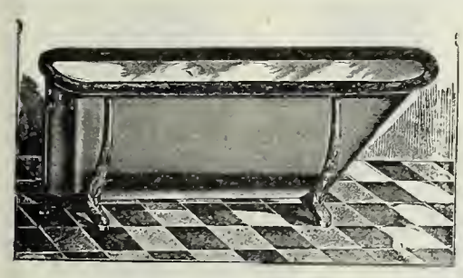
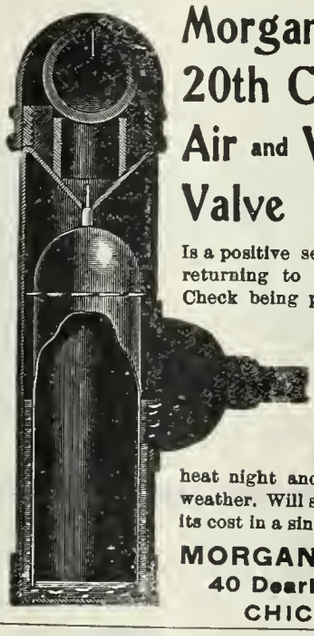
Why It Pays to Buy a No. 10 Coil Fire Pot.

$3.00 Net.



First, it is made by Clayton & Lambert Mfg. Co., and bears their name, *which means your money back if you are not pleased.* In order to sell Fire Pots on this basis it is necessary to *make them better than others.* The tanks are made of *heavy galvanized iron, no tin being used.* The valves are fitted with needle points, which are more durable than ground keys and give the user *much better control of the fire.* Your jobber will supply at factory price. Our catalog is free. It's worth $$ to you.

CLAYTON & LAMBERT MFG. CO.,
DETROIT, MICH., U. S. A.



Our remarkable recent inventions enable us to offer the public an intensely brilliant, smokeless gas at much less cost than city gas, better, safer, and cheaper than electricity, and costing but one-fourth as much as acetylene. Most durable and least expensive apparatus to maintain in effective perpetual operation. Gives services of lighting, cooking, and heating, and operating pumping engines. Fullest satisfaction guaranteed, and easy terms. The very apparatus for suburban homes, institutions, etc. We construct special apparatus also for fuel gas for manufacturing, producing gas equivalent to city gas at 50 cents per 1,000 cubic feet, and made to respond to very large demands; also for lighting towns, etc. Cooking by gas rescues a person from the intolerable heat experienced with other stoves. *Send for Catalogue.*

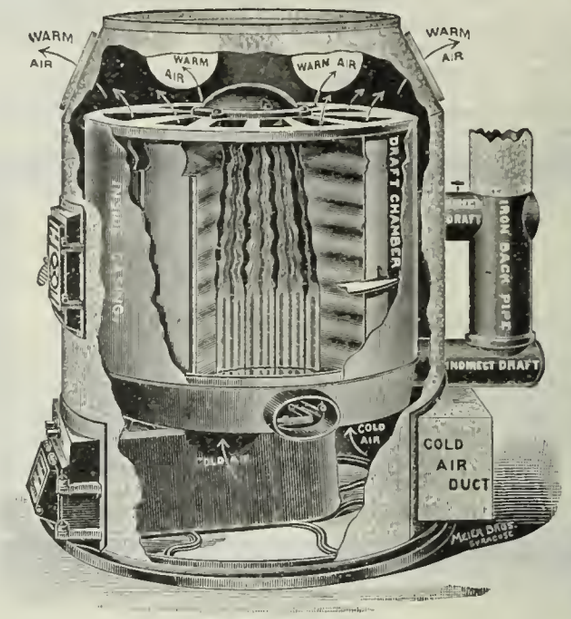
Galvanized range boilers, expansion tanks and boilers with copper tube coils inside for heating water by steam.

L. O. KOVEN & BROTHER,
Office 50 Cliff St., New York City.



The Kelsey Warm Air Generator.

THE PRINCIPLE

Of the Kelsey is to warm great volumes of air by bringing it into **actual contact** with an **extensive** and **properly heated** surface.

This is accomplished by sending the air in **separate channels through** the long hollow corrugated cast iron sections which form the fire chamber.

This is a far more effective method, and the air is more thoroughly and evenly heated, than by simply **passing over** or **next to** a hot surface.

Sectional View.

Each section has eight square feet of heating surface, and weighs about seventy pounds. There are from nine to seventeen sections in each generator, according to its size. This means a powerful and economical heater, and an abundance of pure warm air. Each section is an independent heat generator, and by capping over one or more, and extending a heat-conducting pipe therefrom, the warm air is forced through long or level pipes to the rooms so connected.

Ask for booklets **"KELSEY HEATING"** and **"OPINIONS."**

Protection in the Plumbing Trade.

Trade protection is regarded as an eminently proper principle and is observed more or less in all branches of trade. The protection which has been accorded to the plumber by manufacturers and dealers in plumbing goods has been generous, and it is unfortunate that there should be a division of opinion among the contracting plumbers as to the satisfactory character of this protection. It is freely conceded by all who are thoroughly informed on the subject of trade protection that the plumbing trade is protected to an extent that is enjoyed by no other trade in the United States to-day. The recognition of this fact by conservative plumbers in various sections makes them impatient with the course that is being pursued by some of their fellow members in the trade. In some instances the harmony that formerly existed between local associations in different parts of the same State has been destroyed by the difference of opinion in regard to this matter. In a recent issue we pointed out that some wholesale houses were being notified that unless a grievance, which the latter had not had an opportunity of discussing, was satisfied within a specified time, an order would be issued to the members of the local plumbers' association to withhold orders from those houses. This is looked upon by conservative men in both the wholesale and contracting branch of the business as a rather extreme step, which might be made the basis of action in the courts. Notwithstanding this action in one State reports come that an association in another State are circulating a letter—without a signature, however, although its source clearly seems to be a master plumbers' association—calling attention to an indictment for conspiracy against a master plumbers' association which is said to have been secured through the assistance of a supply house. It is claimed that the statement is made in the indictment that the supply house were threatened with a boycott if they sold material to other than members of the local association. This statement, the circular says, can be proved to be without foundation. The last sentence of the circular letter is as follows: "Appeal is now made to individual members of State and National associations and officers and members of local associations, to stand loyal to the Cleveland Resolution, and if protection of one is the concern of all, it is forcibly needed in this case." Apparently those who prepared this letter did not sympathize with the general feeling that action before the court is to be avoided whenever possible. Already suits have been brought in various parts of the country which have resulted in making public much information that is not of benefit to the plumbing trade. While for some time the manufacturers have taken no action and have not given expression to their views on existing conditions in the plumbing trade, the plumbers seem to have felt no reluctance in assuming a position which, instead of facilitating the restoration of harmony, tends rather to make the settlement of differences more difficult and more remote.

Heating Surface in Boilers.

It is evident that those who design heating plants are becoming desirous of securing such fuller information in reference to the various parts as will enable them to judge of the efficiency of the work. The winter always affords opportunity for study and comparison of the proportion which exists between different parts of a successful apparatus. Heretofore many steam fitters have been satisfied to know the size of the grate in the boilers which they purchased, and thereby have judged of the efficiency of the upper structure for carrying the radiation for which it is rated by the manufacturers. Men who have given the closest study to their work have found, however, that the most satisfactory boilers have a given amount of flue and fire surface. The catalogues of manufacturers have heretofore contained various dimensions of their boilers, but in most instances information as to the surface exposed to contact with the fire, to radiation from the fire and to the flame and gases rising from the fire, has been omitted, the contractor being satisfied to accept the manufacturers' rating or discount it, according to his judgment and experience. There is a class of heating contractors, however, who are now asking that the surface exposed in the boilers be included in the dimensions given in the manufacturers' catalogues, so that they may be better guided in their selection of a boiler for given work. This seems to be a reasonable request, and, as some catalogues already contain this information, it is probable that if the desire for this information is generally shown it will be as generally complied with.

To Abolish Strikes

The announcement from Pittsburgh that the Executive Committee of the Amalgamated Association of Iron, Steel and Tin Workers had arrived at an agreement with the American Steel Hoop Company and the Republic Iron & Steel Company, whereby the mills of those concerns will not shut down this year pending the annual adjustment of the wage scale, marks a gratifying step in the right direction. This action, it may be assumed, will have the effect of doing away with the danger of strikes, at least so far as the employees of the corporations named are concerned. It also holds out the expectation that the precedent may be followed in other works in which the Amalgamated Association is recognized. The hope that there will be no strike over the wage question this year, even if a disagreement over the scales should arise, seems to be justified by the present attitude of the Amalgamated leaders. The new wage scales will be formulated at the annual convention of the

association, to be held at Wheeling, W. Va., in April, nearly two months earlier than heretofore. A strong effort, it is understood, will then be made to have the scale adopted for the present year extend through three years. This proposal, it will be remembered, was made last year, but was not indorsed by a sufficient number of the Amalgamated Association lodges. Since that time, however, it is said the sentiment of the workers has gradually become more favorable toward the idea, so that there is now a much better prospect of the adoption of the three-year wage scale policy. It would seem that such an arrangement should be regarded as eminently desirable from the standpoint both of the manufacturers and the workmen, for it would do away with the annually recurring harassing uncertainty which hitherto has surrounded the question of the wage scales. President Shaffer, at a mass meeting of Amalgamated workers the other day, expressed himself in the strongest terms as opposed to strikes. He declared that the disastrous defeat of last summer had taught the Amalgamated Association a lesson which would not need repetition, and that there would not be another strike. This is right in line with the growing sentiment throughout the country, which found its expression in the recent industrial conference of the National Civic Federation in New York City. It is a gratifying fact that strikes are becoming more and more difficult of accomplishment, and that labor leaders everywhere are declaring against their use. There is no reason to expect an early industrial millennium, but every ground exists for expecting the gradual abolition of strikes. This is much to be thankful for.

Retail Hardware Associations.

An opportunity will be given during the present month to all who are interested in the matter of retail hardware organization to study the spirit, progress and tendencies of this important movement. While it is only within a few years that there has been anything like a general effort on the part of retail merchants to associate themselves together for the advancement of their interests, the movement has attained a recognized position in the trade and the associations are beginning to exert an important influence. While many manufacturers and jobbers were at first inclined to regard the movement as impracticable, if not objectionable, it has in very large measure come to command the respect and approval of the trade at large. In the various State associations many strong and progressive merchants are brought together to deliberate on matters affecting their mutual interests. The contact of merchants who come together for this object is in itself very desirable and cannot fail to have good results. The way in which the many trade questions are considered by them will give especial interest to the many meetings of their associations, so many of which occur this month. There are so many advantages connected with organization among the retail trade, and so much to be accomplished in the advancement of its interests, that we bespeak for the various State associations the loyal support of the merchants. In most of the States the membership is as yet comparatively limited, when, in fact, it should embrace all the larger and more progressive retail merchants. It is perhaps too much to expect that merchants doing a very limited business in remote places and out of touch with the trade at large should become actively identified with the movement. The movement is one, however, which makes especial appeal for the sympathy and co-operation of merchants of breadth of view, up to date methods and progressive spirit. The manner in which this representative class regard trade questions and tendencies will be watched with much interest, not only by other retail merchants throughout the country, but by manufacturers and jobbers who desire to be in touch with their customers, whose attitude on these questions has so important a bearing on the welfare and policy of the trade as a whole.

Wages and Plumbing Companies.

There are many indications that the course of 1902 will be marked by efforts for a change in the wages of plumbers throughout the country. Reports from many cities show the existence of a demand for shorter hours and increased pay, as well as an agitation of the apprenticeship question in a manner that threatens the interests of the master plumbers. Unfortunately there is manifested a feeling that the master plumber can charge his customers any price he desires, so as to reimburse him for the payment made in wages to his workmen. There seems to be an indifference on the part of the journeyman plumber as to the financial result to his employer, when he loses an hour from whatever cause. For this hour he receives pay, but it may cause a loss to his employer from the day's work. There can be no doubt that in the course of a year the agitations of the wage question in its various forms by the journeyman plumber costs him several days' work, which loss could be avoided if this annual agitation of the wage question could be obviated This question has been successfully solved in some instances by the employer forming a plumbing company and taking into the company with him enough practical men to do all of the work that will ordinarily come to the shop in dull seasons. By this plan it is only necessary to hire a little extra help at the market price in the rush season. At all other seasons the members of the company do the work at a regular wage and participate in the profits, if there are any, at the end of the year. It has been the experience of those who have formed such companies that the practical members of the company accomplish more work, take a more lively interest in their work, and do it better than when employed as journeymen. If these men estimate on a piece of work they are ambitious to carry it out within the time of their estimate, and are willing to work harder to do this in case they have made an error in underestimating. They have a deeper interest in establishing a reputation for good work and in pleasing customers. The increase of such companies throughout the United States has been very marked within the past year, and the adopting of this policy is now being contemplated by many others who heretofore have been much harassed every spring by the annual agitation of the labor question.

It is one of the accompaniments of prosperity that the demand is unusually large for articles of high grade and necessarily of high price, and this has been particularly true since 1898. Added to this is the growing taste and intelligence of the people, which call for better things. In the days of depression—which sooner or later must ensue—it will be interesting to note as to what extent the demand will be for cheaper and inferior goods, and also as to what extent public taste has moved up to a higher plane of appreciation of quality and excellence.

Consolidation in the Stove Trade.

Those who favor a consolidation of interests in the stove trade have naturally withheld information of their efforts and success from those not directly interested. This, however, has not prevented rumors to the effect that the success of such efforts is near at hand, and credence is given to the various rumors according to their source. "One who is to go in" is reported to have said that "forty-two Western stove concerns will, on March 1, enter a combination or a trust, with a capital of several millions." The report also has it that some concerns who desire to enter have been denied. Recently there have been several increases in capitalization among stove houses that are looked upon by some as preparatory steps to consolidation. It is also an open secret that the deliberations of the Boston convention were given up to the discussion of various phases of the consolidation question, and that several promoters and lawyers have been identified with such a scheme during the year. Among the many rumors current is one to the effect that the manufacturers invited themselves to New York for the next convention, in May, so that a consummated consolidation might be announced at this important center. Time will verify or refute these various rumors and reports.
